

Module 4: Building APIs

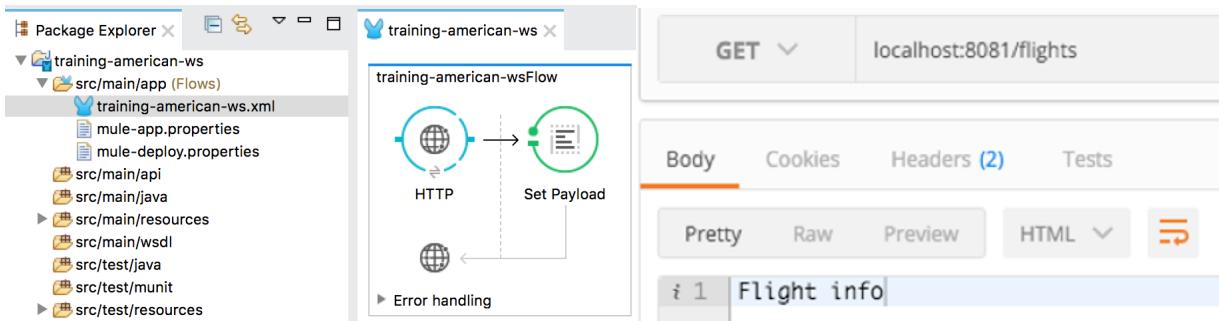

At the end of this module, you should be able to:

- Use Anypoint Studio to build, run, and test Mule applications.
- Use a connector to connect to databases.
- Use the graphical DataWeave editor to transform data.
- Create RESTful interfaces for applications from RAML files.
- Connect API interfaces to API implementations.

Walkthrough 4-1: Create a Mule application with Anypoint Studio

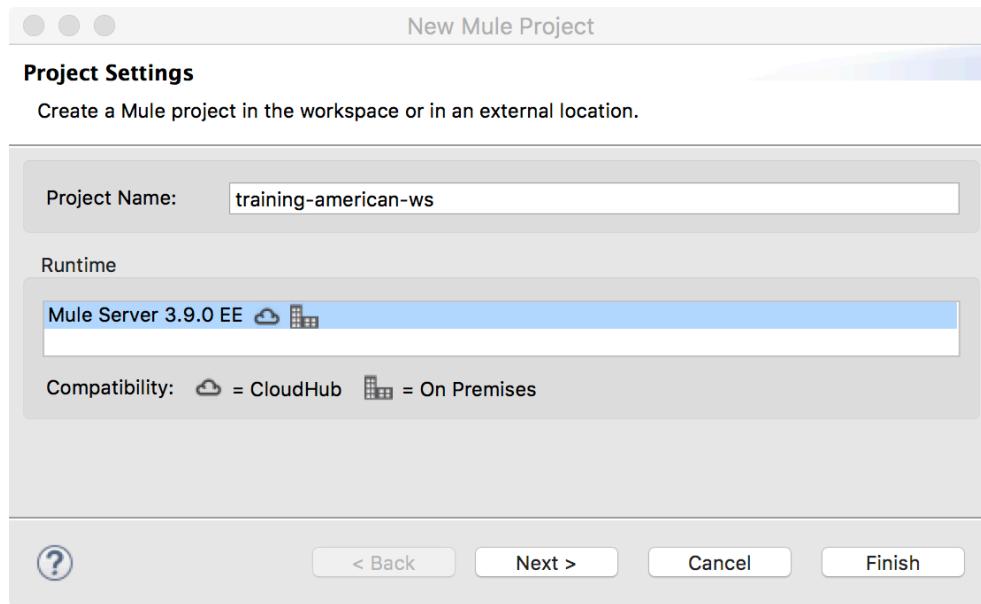

In this walkthrough, you build a Mule application. You will:

- Create a new Mule project with Anypoint Studio.
- Add a connector to receive requests at an endpoint.
- Set the message payload.
- Run a Mule application using the embedded Mule runtime.
- Make an HTTP request to the endpoint using Postman.

Create a Mule project

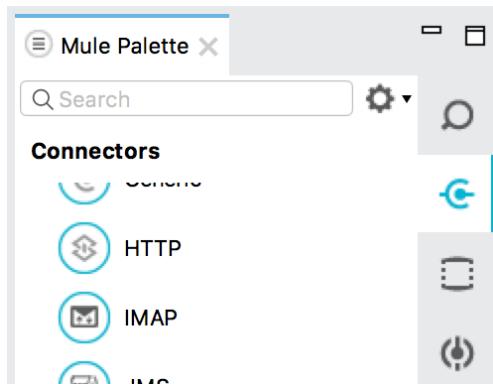

1. Open Anypoint Studio.
2. Select File > New > Mule Project.
3. In the New Mule Project dialog box, set the Project Name to training-american-ws.
4. Ensure the Runtime is set to the latest version of Mule.

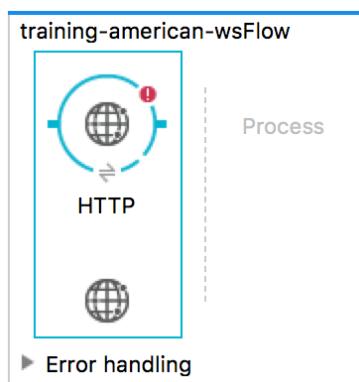

5. Click Finish.

Create an HTTP connector endpoint to receive requests

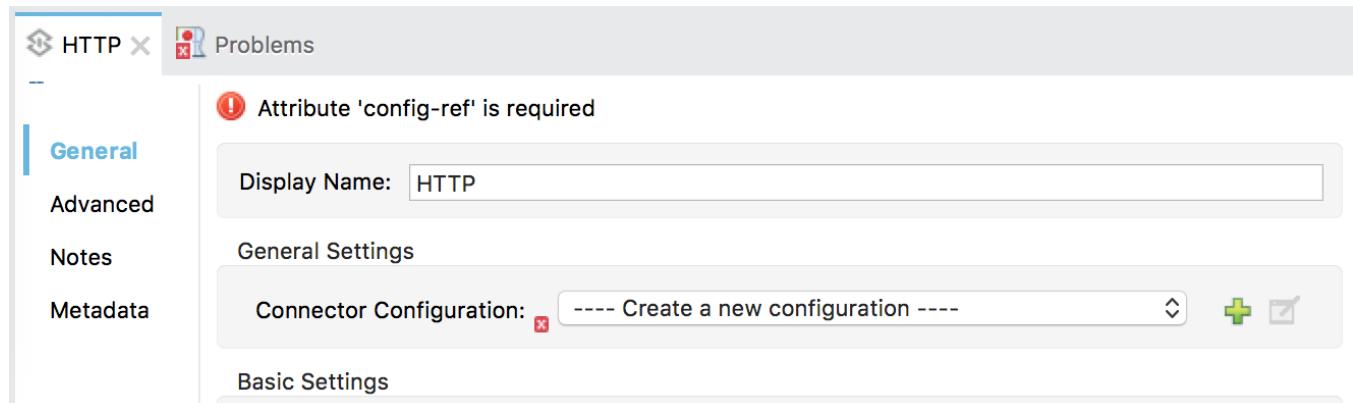

6. In the Mule Palette, select the Connectors tab.

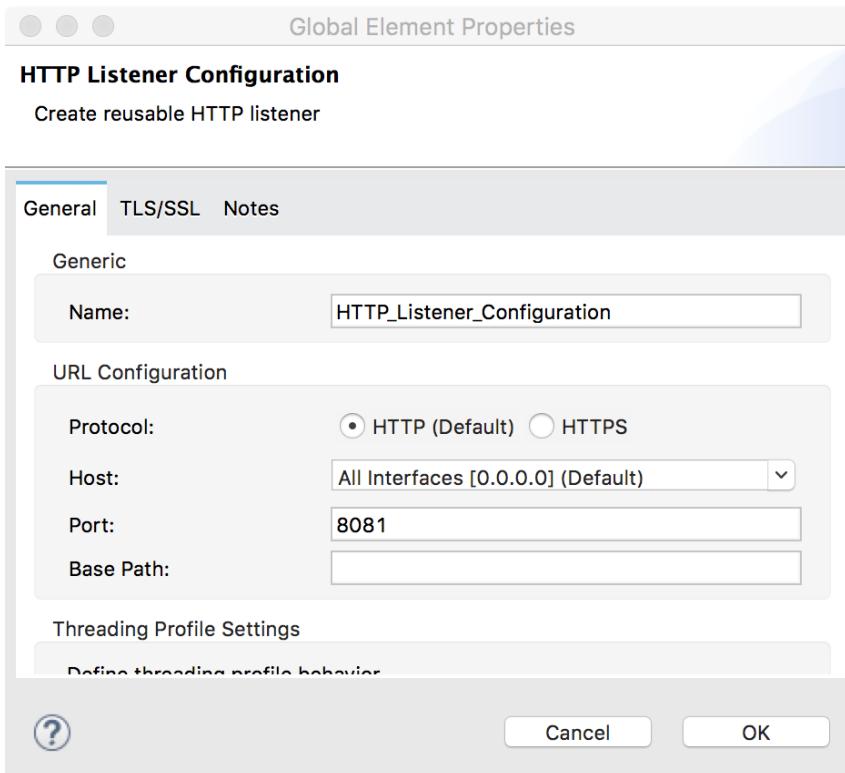

7. Drag an HTTP connector from the Mule Palette to the canvas.

8. Double-click the HTTP endpoint.
9. In the HTTP Properties view that opens at the bottom of the window, click the Add button next to connector configuration.

10. In the Global Element Properties dialog box, look at the default values and click OK.

11. In the HTTP properties view, set the path to /flights.

12. Set the allowed methods to GET.

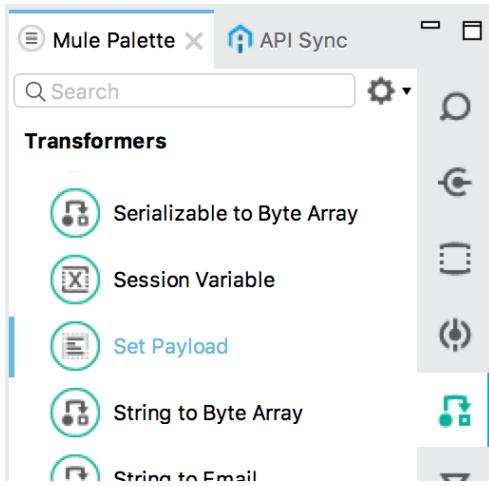

13. Click the Apply Changes button; the errors in the Problems view should disappear.

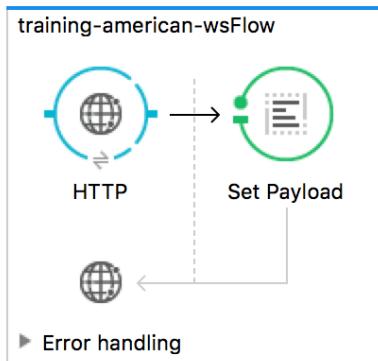

Display data

14. In the Mule Palette, select the Transformers tab.

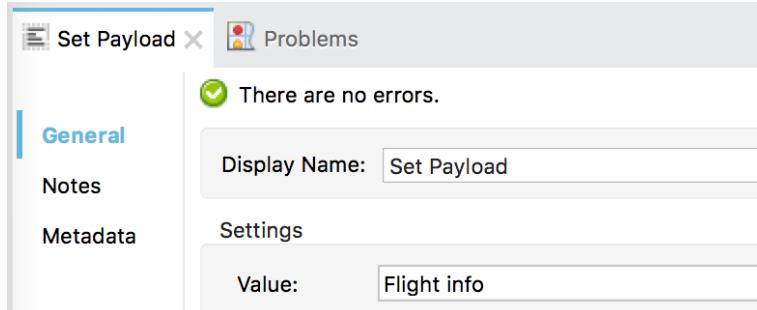

15. Drag a Set Payload transformer from the Mule Palette into the process section of the flow.

Configure the Set Payload transformer

16. In the Set Payload properties view, set the value field to Flight info.

17. Click the Configuration XML link at the bottom of the canvas and examine the corresponding XML.

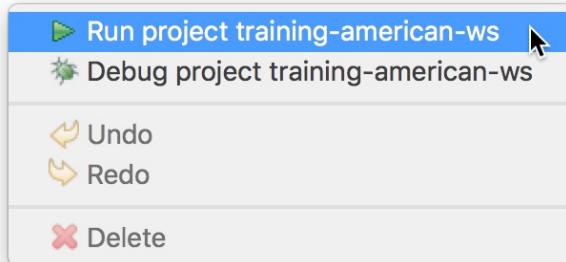

```
1 <?xml version="1.0" encoding="UTF-8"?>
2
3<mule xmlns:http="http://www.mulesoft.org/schema/mule/http" xmlns="http://www.mulesoft.or
4    xmlns:spring="http://www.springframework.org/schema/beans"
5    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
6    xsi:schemaLocation="http://www.springframework.org/schema/beans http://www.springfram
7    http://www.mulesoft.org/schema/mule/core http://www.mulesoft.org/schema/mule/core/current
8        <http:listener-config name="HTTP_Listener_Configuration" host="0.0.0.0" port="8081" d
10<flow name="training-american-wsFlow">
11    <http:listener config-ref="HTTP_Listener_Configuration" path="/flights" allowedMe
12        <set-payload value="Flight info
13    " doc:name="Set Payload"/>
14</flow>
15</mule>
```

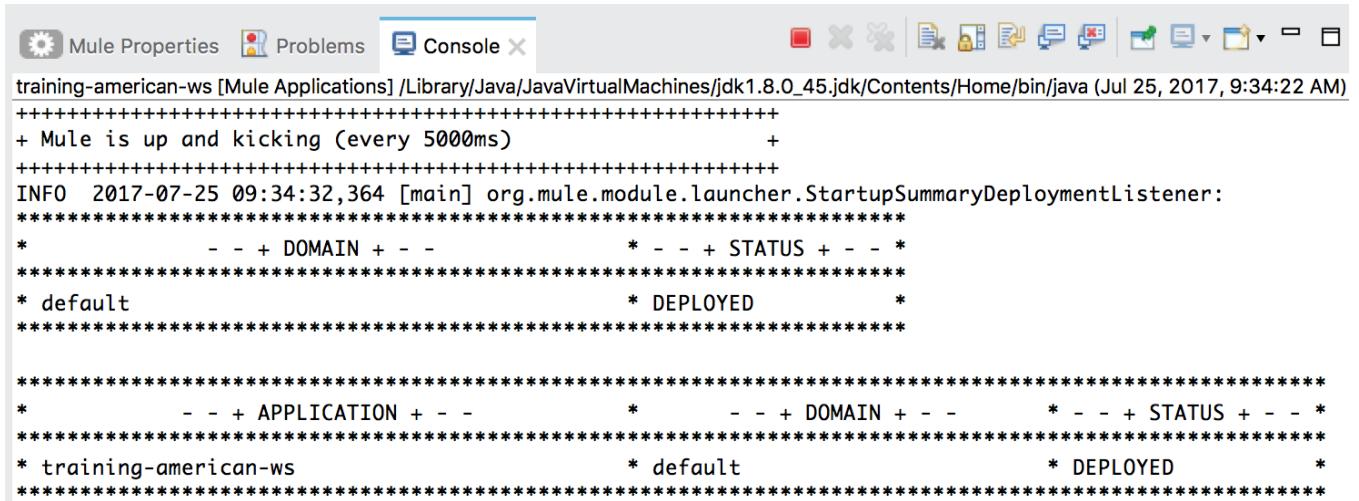

18. Click the Message Flow link to return to the canvas.
19. Click the Save button or press Cmd+S or Ctrl+S.

Run the application

20. Right-click in the canvas and select Run project training-american-ws.

21. Watch the Console view; it should display information letting you know that both the Mule runtime and the training-american-ws application started.

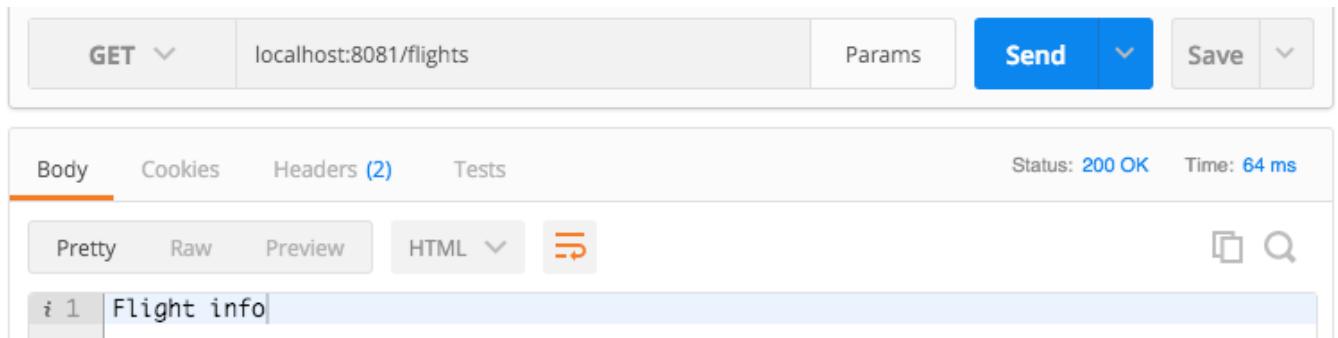

```
training-american-ws [Mule Applications] /Library/Java/JavaVirtualMachines/jdk1.8.0_45.jdk/Contents/Home/bin/java (Jul 25, 2017, 9:34:22 AM)
+++++
+ Mule is up and kicking (every 5000ms) +
+++++
INFO 2017-07-25 09:34:32,364 [main] org.mule.module.launcher.StartupSummaryDeploymentListener:

*****
***** - - + APPLICATION + - - * - - + DOMAIN + - - * - - + STATUS + - - *
*****
* training-american-ws * default * DEPLOYED *
*****
```

Test the application

22. Return to Postman.

23. Make sure the method is set to GET and that no headers or body are set for the request.

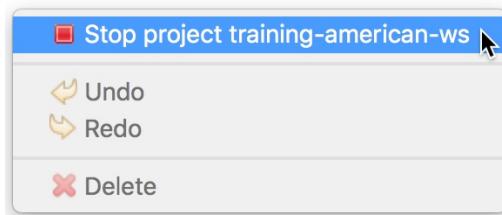

24. Make a GET request to <http://localhost:8081/flights>; you should see Flight info displayed.

The screenshot shows the Postman interface. At the top, there's a header bar with 'GET' selected, the URL 'localhost:8081/flights', and a 'Send' button. Below the header, there are tabs for 'Body', 'Cookies', 'Headers (2)', and 'Tests'. The 'Headers (2)' tab is active. To the right, status information 'Status: 200 OK' and 'Time: 64 ms' is displayed. Under the 'Body' tab, there are buttons for 'Pretty', 'Raw', 'Preview', and 'HTML'. A preview window shows the response: 'Flight info'. The entire interface is white with blue and grey accents.

25. Return to Anypoint Studio.

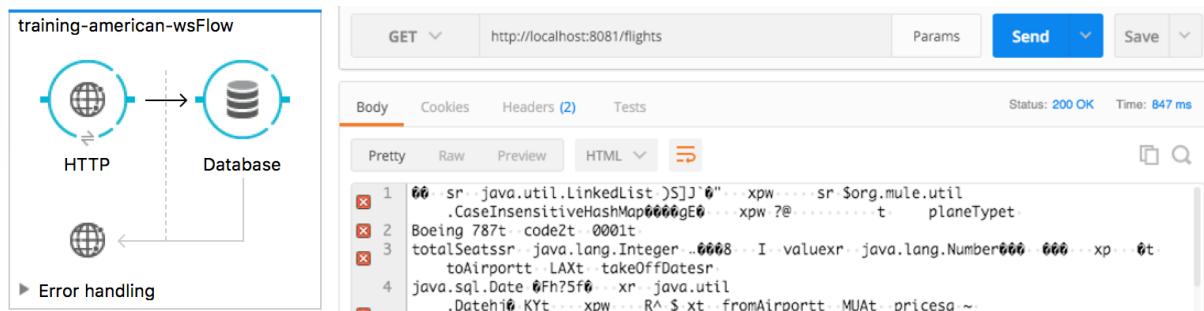

26. Right-click in the canvas and select Stop project training-american-ws.

Walkthrough 4-2: Connect to data (MySQL database)

In this walkthrough, you connect to a database and retrieve data from a table that contains flight information. You will:

- Add a Database connector endpoint.
- Configure a Database connector that connects to a MySQL database (or optionally an in-memory Derby database if you do not have access to port 3306).
- Configure the Database endpoint to use that Database connector.
- Write a query to select data from a table in the database.

Locate database information

1. Return to the course snippets.txt file and locate the MySQL and Derby database information.

```
* MySQL database
db.host = mudb.mulesoft-training.com
db.port = 3306
db.user = mule
db.password = mule
db.database = training
American table: american
American table version2: flights
Account table: accounts
Account list URL: http://mu.mulesoft-training.com/essentials/accounts/show
or http://localhost:9090/essentials/accounts/show.html

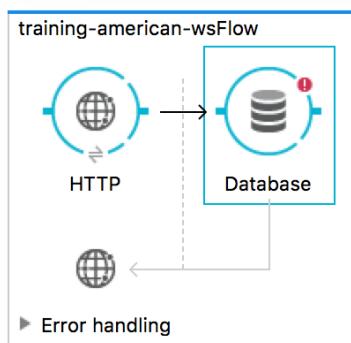

* Derby database
driverName: org.apache.derby.jdbc.ClientDriver
url: jdbc:derby://localhost:1527/memory:training
```

Note: The database information you see may be different than what is shown here; the values in the snippets file differ for instructor-led and self-study training classes.

Add a Database connector endpoint

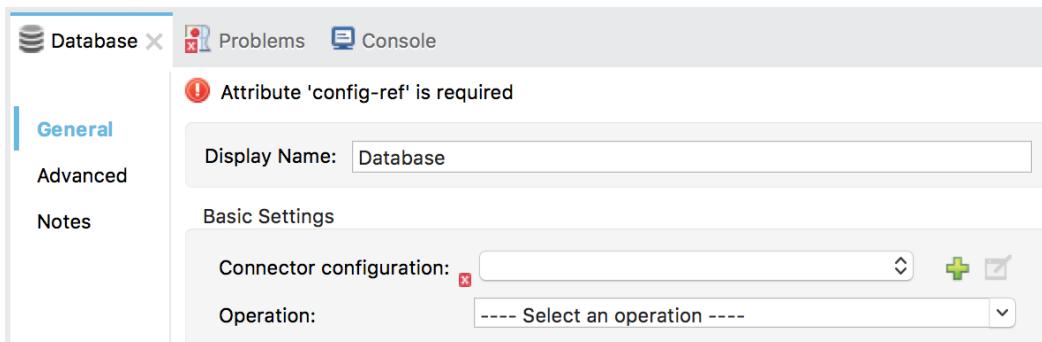

2. Return to Anypoint Studio.
3. Right-click the Set Payload message processor and select Delete.

- In the Mule Palette, select the Connectors tab.
- Drag a Database connector to the process section of the flow.

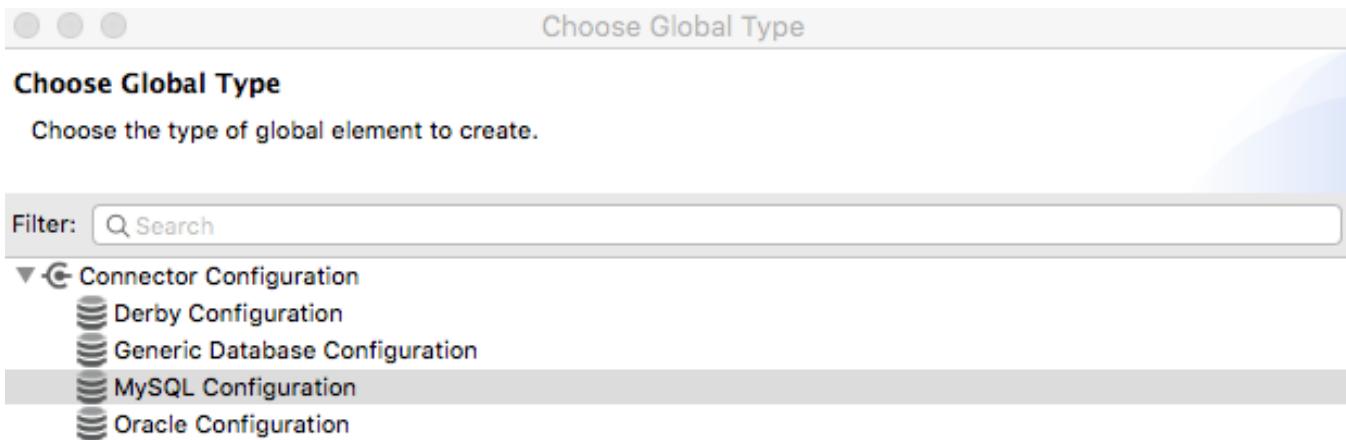

Option 1: Configure a MySQL Database connector (if you have access to port 3306)

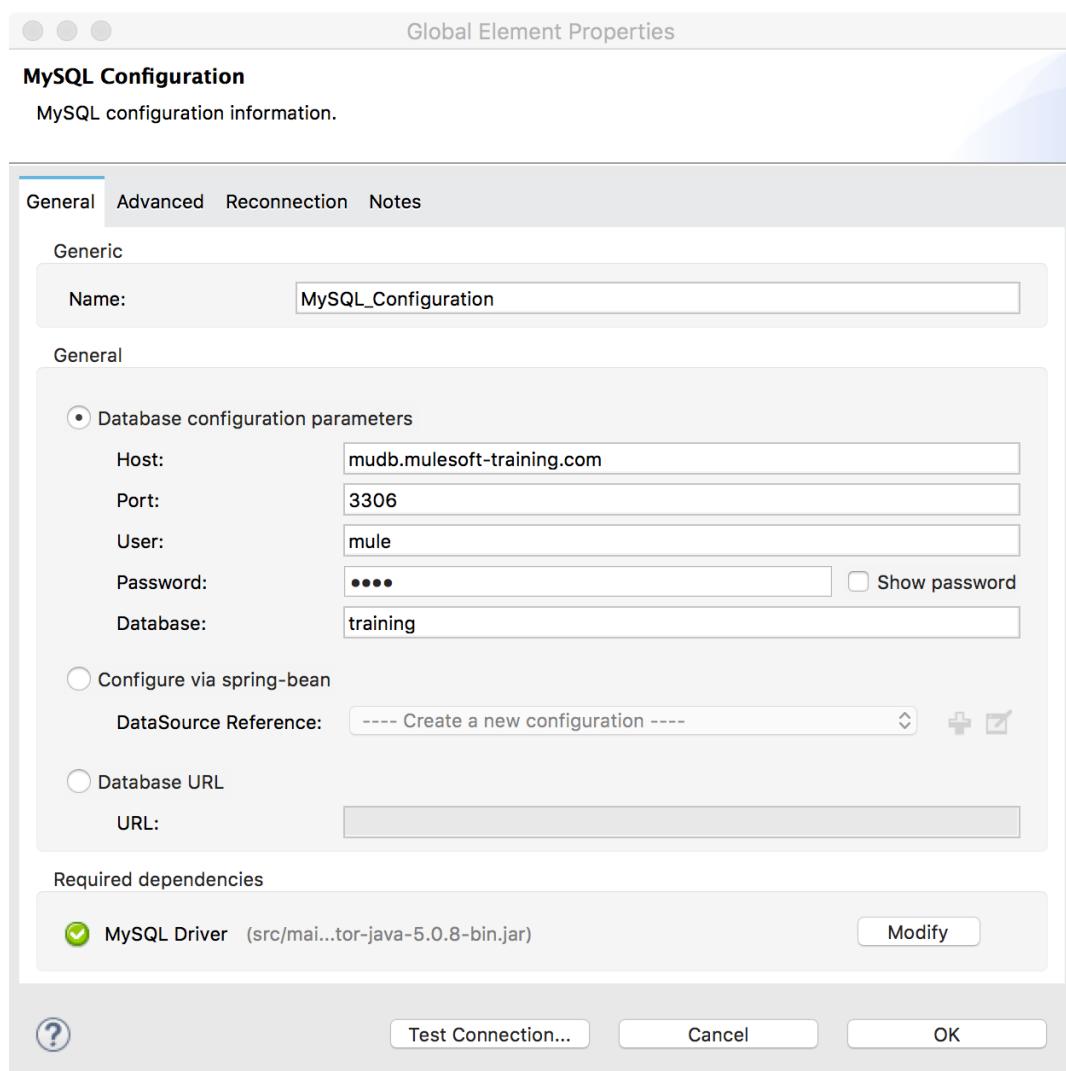

- Double-click the Database endpoint.
- In the Database properties view, click the Add button next to connector configuration.

- In the Choose Global Type dialog box, select Connector Configuration > MySQL Configuration and click OK.

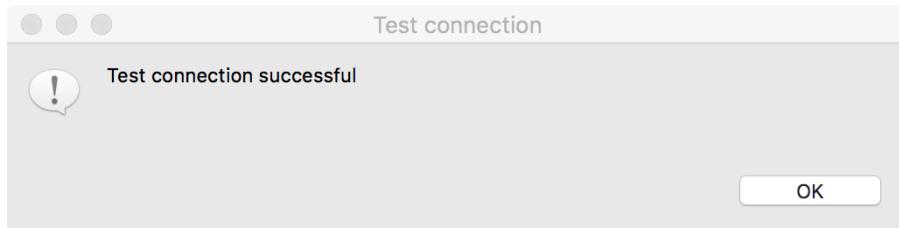

- In the Global Element Properties dialog box, set the server, port, user, password, and database values to the values listed in the course snippets.txt file.
- Under Required dependencies, click the Add File button next to MySQL Driver.
- Navigate to the student files folder, select the MySQL JAR file located in the jars folder, and click Open.

12. Back in the Global Element Properties dialog box, click the Test Connection button; you should get a successful test dialog box.

Note: Make sure the connection succeeds before proceeding.

Note: If the connectivity test fails, make sure you are not behind a firewall restricting access to port 3306. If you cannot access port 3306, use the instructions in the next section for option 2.

13. Click OK to close the dialog box.
14. Click OK to close the Global Element Properties dialog box.

Option 2: Configure a Derby Database connector (if no access to port 3306)

15. In a command-line interface, use the cd command to navigate to the folder containing the jars folder of the student files.
16. Run the mulesoft-training-services.jar file.

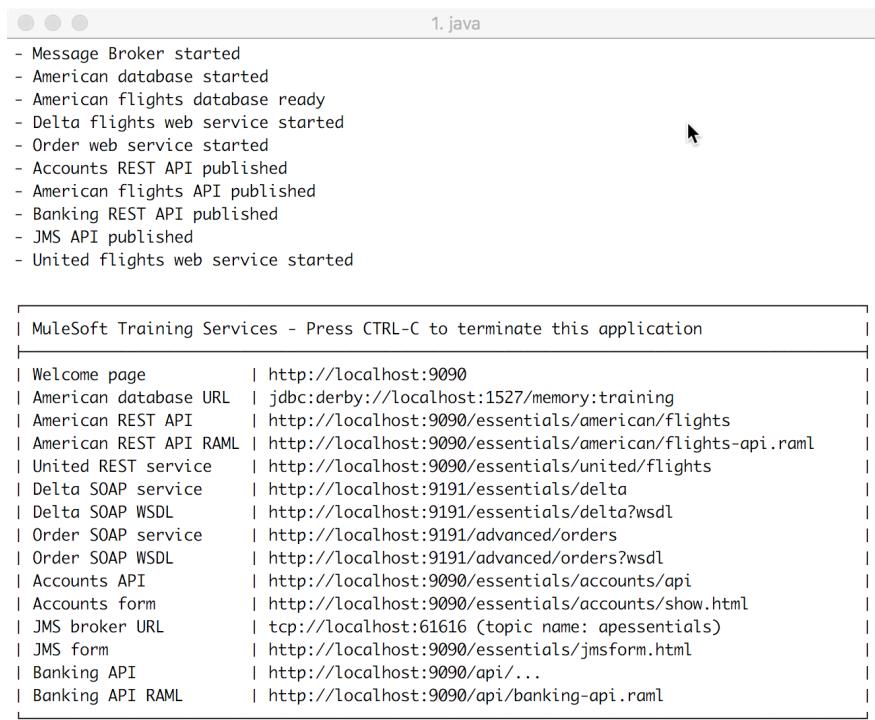

```
java -jar mulesoft-training-services-X.X.X.jar
```

Note: Replace X.X.X with the version of the JAR file, for example 1.5.0.

Note: The application uses ports 1527, 9090, 9091, and 61616. If any of these ports are already in use, you can change them when you start the application as shown in the following code.

```
java -jar mulesoft-training-services-X.X.X.jar --database.port=1530 --  
ws.port=9092 --spring.activemq.broker-url=tcp://localhost:61617 --  
server.port=9193
```

17. Look at the output and make sure all the services started.

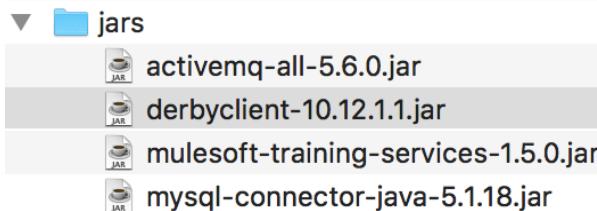

```
1.java
- Message Broker started
- American database started
- American flights database ready
- Delta flights web service started
- Order web service started
- Accounts REST API published
- American flights API published
- Banking REST API published
- JMS API published
- United flights web service started

| MuleSoft Training Services - Press CTRL-C to terminate this application
| Welcome page | http://localhost:9090
| American database URL | jdbc:derby://localhost:1527/memory:training
| American REST API | http://localhost:9090/essentials/american/flights
| American REST API RAML | http://localhost:9090/essentials/american/flights-api.raml

| Banking API RAML | http://localhost:9090/api/banking-api.raml
```

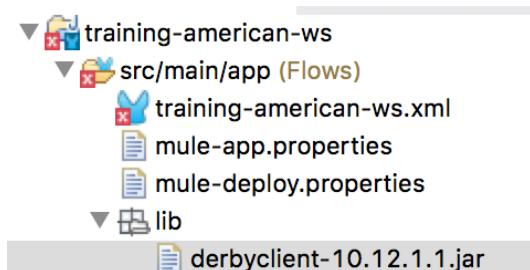

□

Note: When you want to stop the application, return to this window and press Ctrl+C.

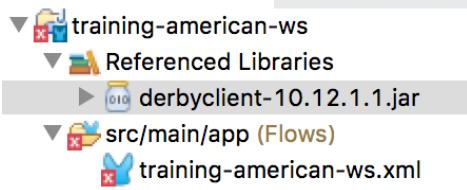

18. In the computer's file explorer, return to the student files folder and locate the derbyclient.jar file in the jars folder.

19. Copy and paste or drag this JAR file into the src/main/app/lib folder of the project in Anypoint Studio.

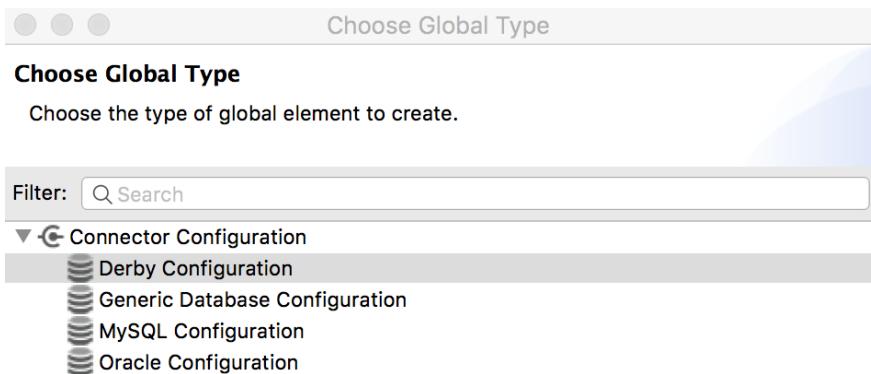

20. Right-click the JAR file and select Build Path > Add to Build Path; you should now see the JAR file in the project's Referenced Libraries.

21. Double-click the Database endpoint in the canvas.

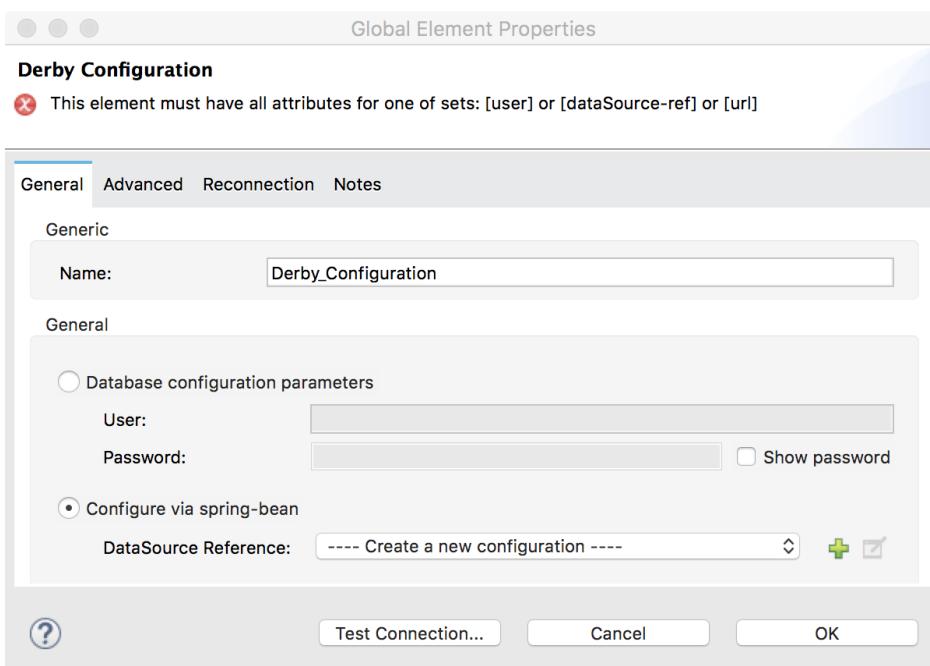

22. In the Database properties view, click the Add button next to connector configuration.

23. In the Choose Global Type dialog box, select Connector Configuration > Derby Configuration and click OK.

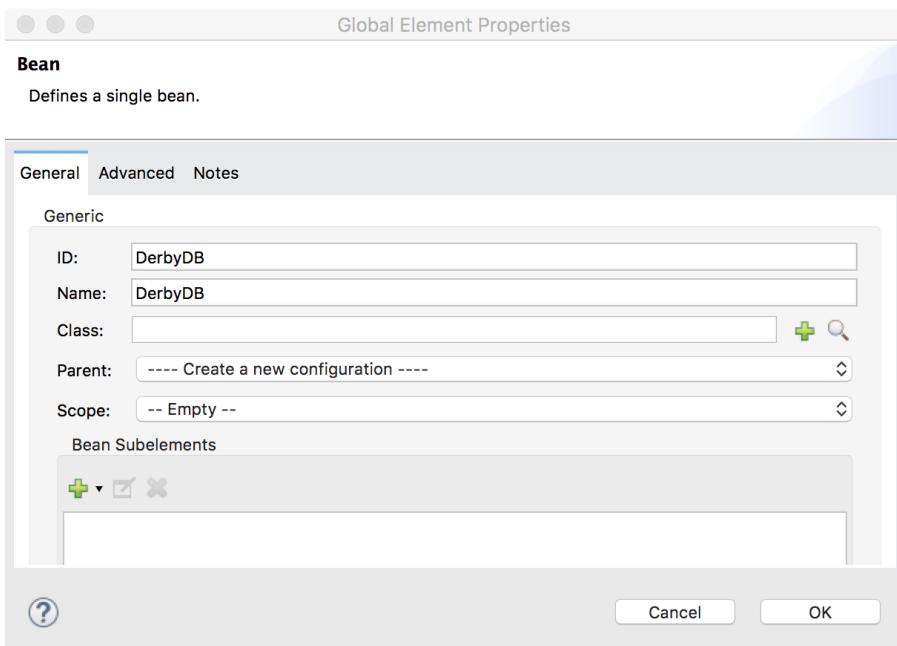

24. In the Global Element Properties dialog box, select Configure via spring-bean.

25. Click the Add button next to DataSource Reference.

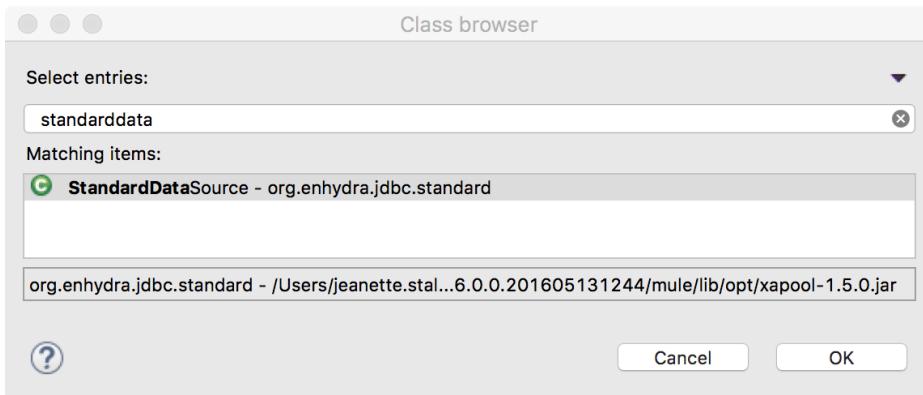

26. On the Bean page of the Global Element Properties dialog box, set the ID and name to DerbyDB.

27. Click the Browse for Java class button next to class.

28. In the Class browser dialog box, start typing StandardDataSource and select the matching item for StandardDataSource – org.enhydra.jdbc.standard.

29. Click OK.

30. On the Bean page of the Global Element Properties dialog box, click the Add button under Bean Subelements and select Add Property.

31. In the Property dialog box, set the following values:

- Name: driverName
- Value: org.apache.derby.jdbc.ClientDriver

Note: You can copy this value from the course snippets.txt file.

32. Click Finish.

33. Click the Add button under Bean Subelements again and select Add Property.

34. In the Property dialog box, set the following values:

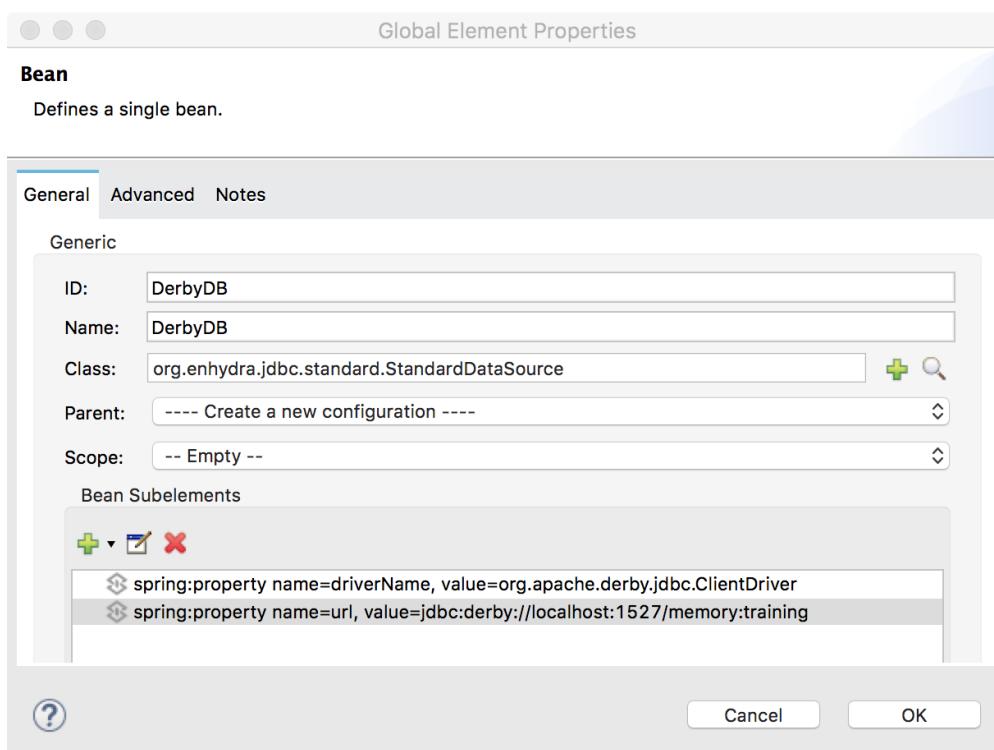

- Name: url
- Value: jdbc:derby://localhost:1527/memory:training

Note: You can copy this value from the course snippets.txt file.

Note: If you changed the database port when you started the mulesoft-training-services application, be sure to use the new value here.

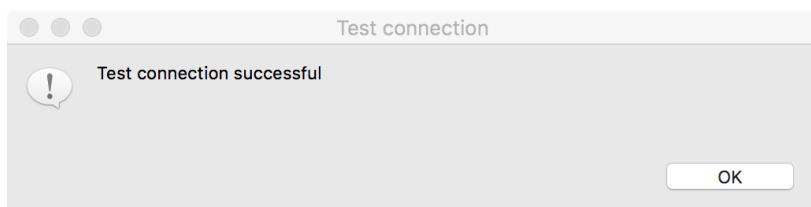

35. Click Finish.

36. On the Bean page of the Global Element Properties dialog box, click OK.

37. On the Derby Configuration page of the Global Element Properties dialog box, click Test Connection; you should get a successful test dialog box.

Note: Make sure the connection succeeds before proceeding.

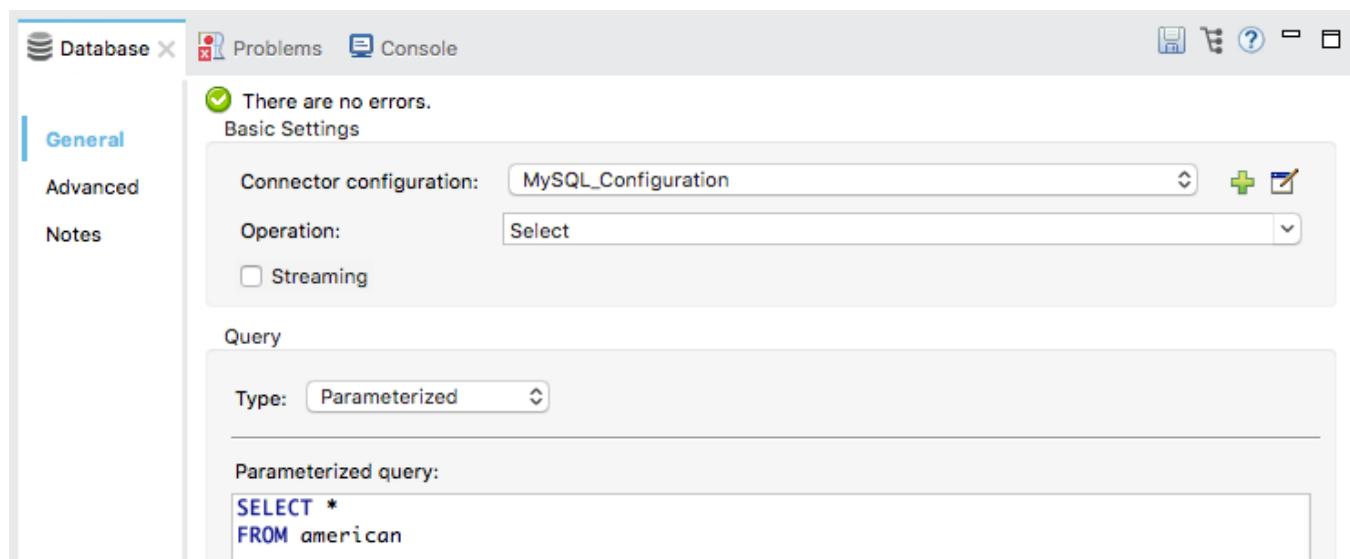

38. Click OK to close the dialog box.
39. Click OK to close the Global Element Properties dialog box.

Write a query to return all flights

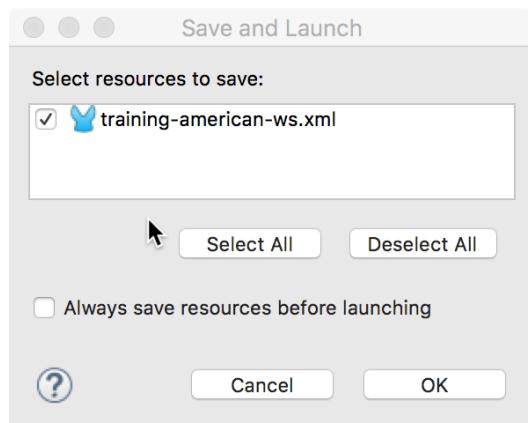

40. In the Database properties view, set the operation to Select.
41. Add a query to select all records from the american table.

```
SELECT *
FROM american
```

Test the application

42. Run the project.
43. In the Save and launch dialog box, select Always save resources before launching and click OK.

44. Watch the console, and wait for the application to start.
45. Once it has started, return to Postman.
46. In Postman, make another request to <http://localhost:8081/flights>; you should get some garbled plain text displayed – the tool's best representation of Java objects.

The screenshot shows the Postman interface with a GET request to `http://localhost:8081/flights`. The response is successful (200 OK) and took 847 ms. The body is displayed in Pretty format, showing a list of flight objects:

```
1 sr..java.util.LinkedList )S]J`" .. xpw.....sr $org.mule.util
    .CaseInsensitiveHashMap@0000gE0 .. xpw ?@ .....t.... planeType
2 Boeing 787t.. code2t.. 0001t
3 totalSeatssr.. java.lang.Integer .. 0008 .. I .. valuexr.. java.lang.Number@000.. 000 .. xp...@t...
    toAirportt.. LAXt.. takeOffDatesr
4 java.sql.Date @Fh?5f0 .. xr.. java.util
    .Datehj@ KYt .. xpw... R^ $ xt.. fromAirportt.. MUAt.. pricesq ~
```

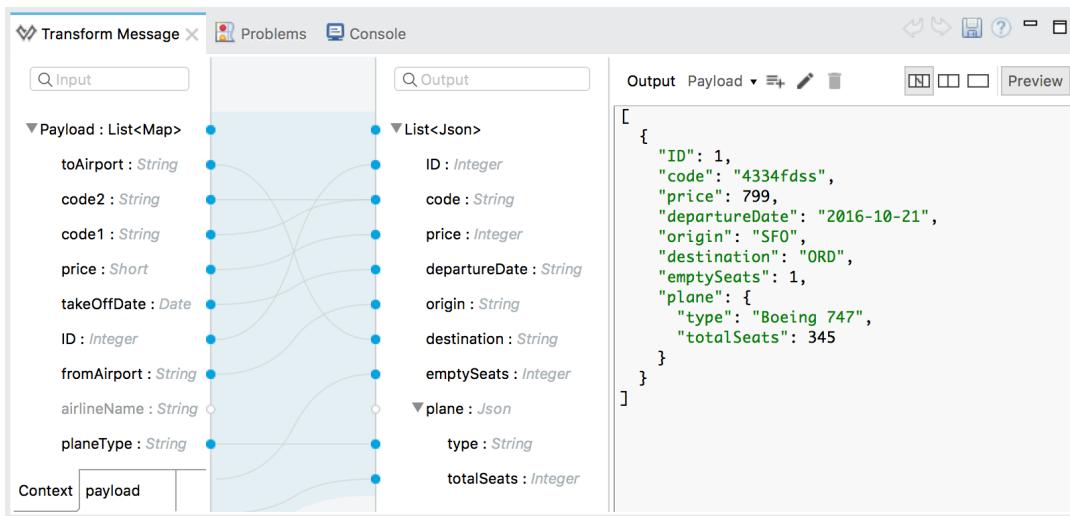

47. Return to Anypoint Studio.

48. Stop the project.

Walkthrough 4-3: Transform data

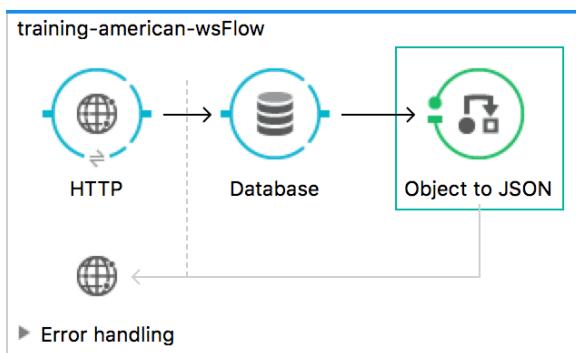

In this walkthrough, you transform and display the account data into JSON. You will:

- Use the Object to JSON transformer.
- Replace it with a Transform Message component.
- Use the DataWeave visual mapper to change the response to a different JSON structure.

Add an Object to JSON transformer

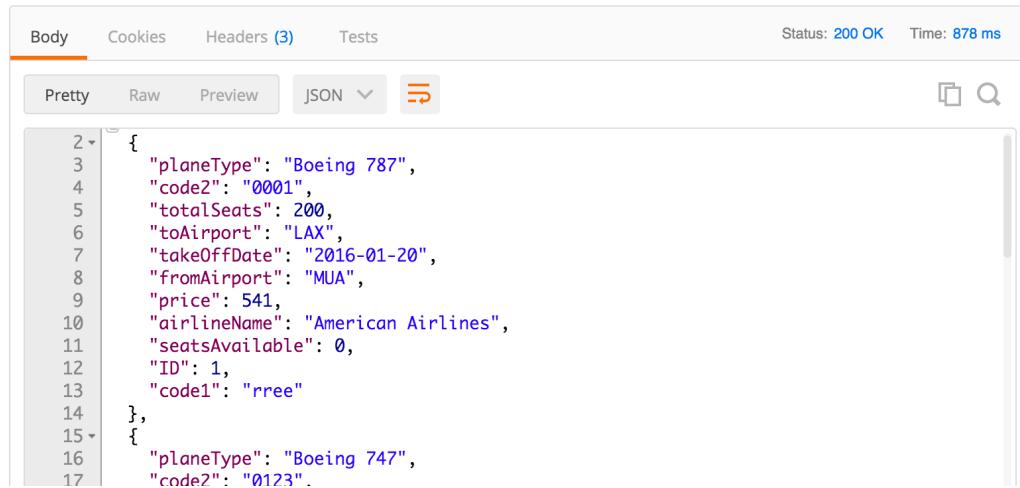

1. In the Mule Palette, select the Transformers tab.
2. Drag an Object to JSON transformer from the Mule Palette and drop it after the Database endpoint.

Test the application

3. Run the project.

4. In Postman, send the same request; you should see the American flight data represented as JSON.

The screenshot shows the Postman interface with a status bar indicating "Status: 200 OK" and "Time: 878 ms". The "Body" tab is selected, displaying a JSON response with two flight objects. The JSON is formatted with line numbers and collapsible sections:

```

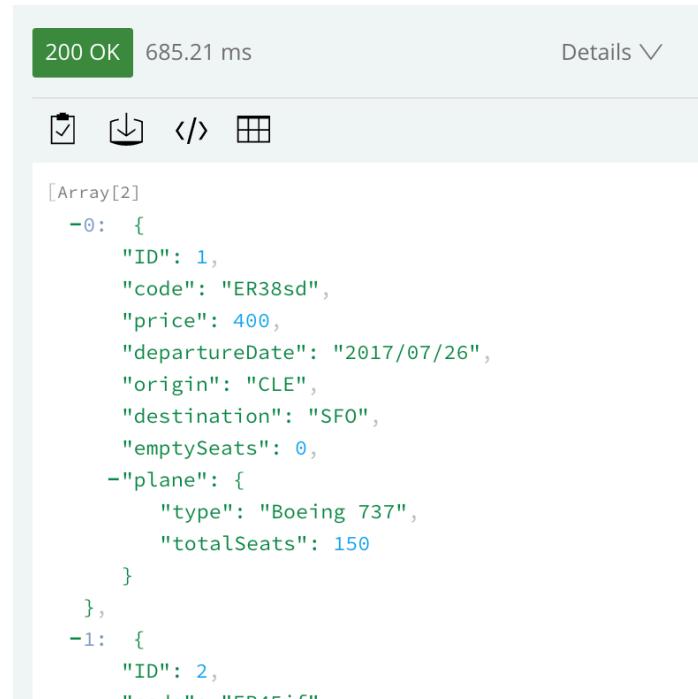

2 {
3   "planeType": "Boeing 787",
4   "code2": "0001",
5   "totalSeats": 200,
6   "toAirport": "LAX",
7   "takeOffDate": "2016-01-20",
8   "fromAirport": "MUA",
9   "price": 541,
10  "airlineName": "American Airlines",
11  "seatsAvailable": 0,
12  "ID": 1,
13  "code1": "rree"
14 },
15 {
16   "planeType": "Boeing 747",
17   "code2": "0123".

```

Note: If you are using the local Derby database, the properties will be uppercase instead.

Review the data structure to be returned by the American flights API

5. Return to your American Flights API in Exchange.
 6. Look at the example data returned for the /flights GET method.

The screenshot shows the Exchange API response for the "/flights" endpoint. The response is a 200 OK with a duration of 685.21 ms. The body is an array of two flight objects:

```

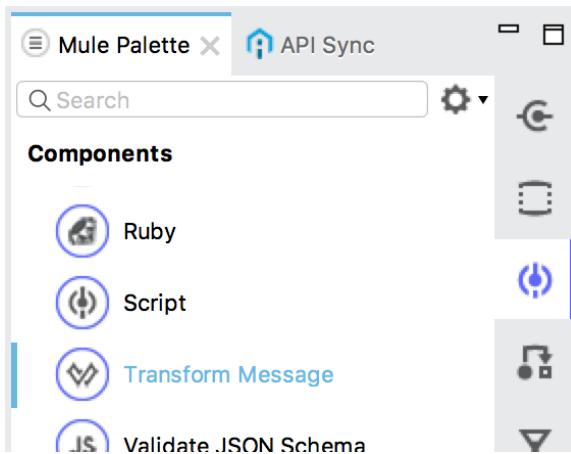

[Array[2]
-0: {
  "ID": 1,
  "code": "ER38sd",
  "price": 400,
  "departureDate": "2017/07/26",
  "origin": "CLE",
  "destination": "SFO",
  "emptySeats": 0,
  "plane": {
    "type": "Boeing 737",
    "totalSeats": 150
  }
},
-1: {
  "ID": 2,
  "code": "FR451F"
}
]

```

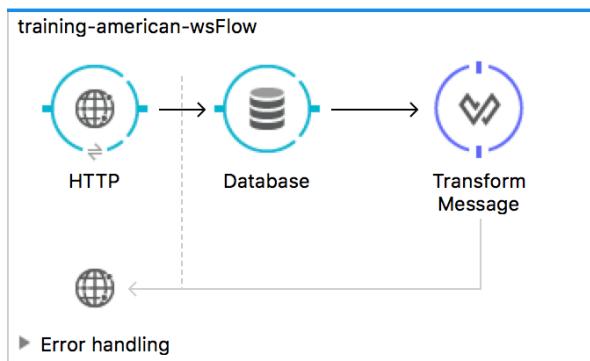

7. Notice that the structure of the JSON being returned by the Mule application does not match this JSON.

Add a Transform Message component

8. Return to Anypoint Studio and stop the project.
9. Right-click the Object to JSON transformer and select Delete.
10. In the Mule Palette, select the Components tab.

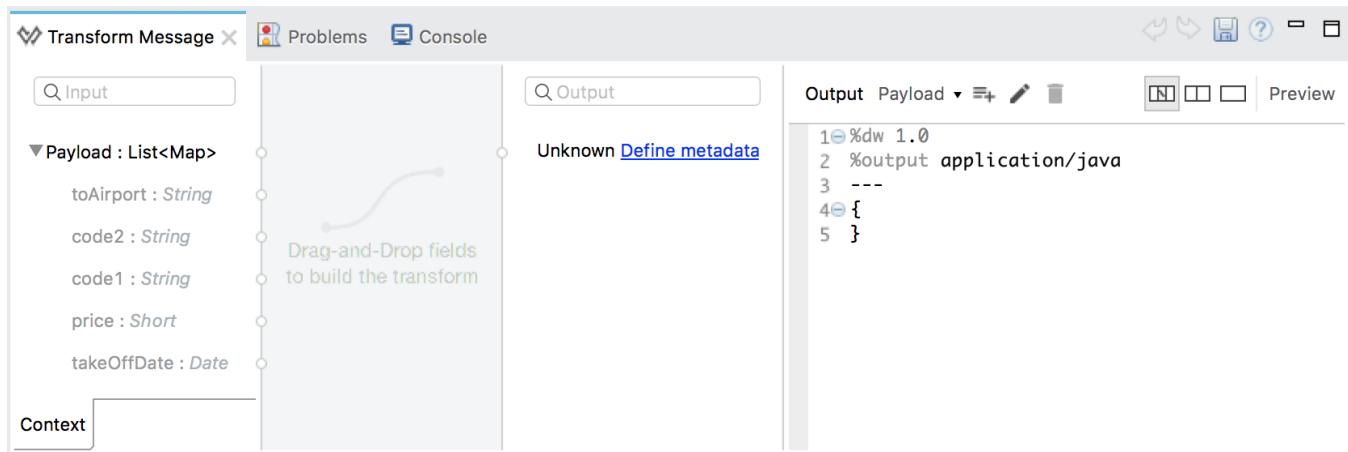

11. Drag a Transform Message component from the Mule Palette and drop it after the Database endpoint.

Review metadata for the transformation input

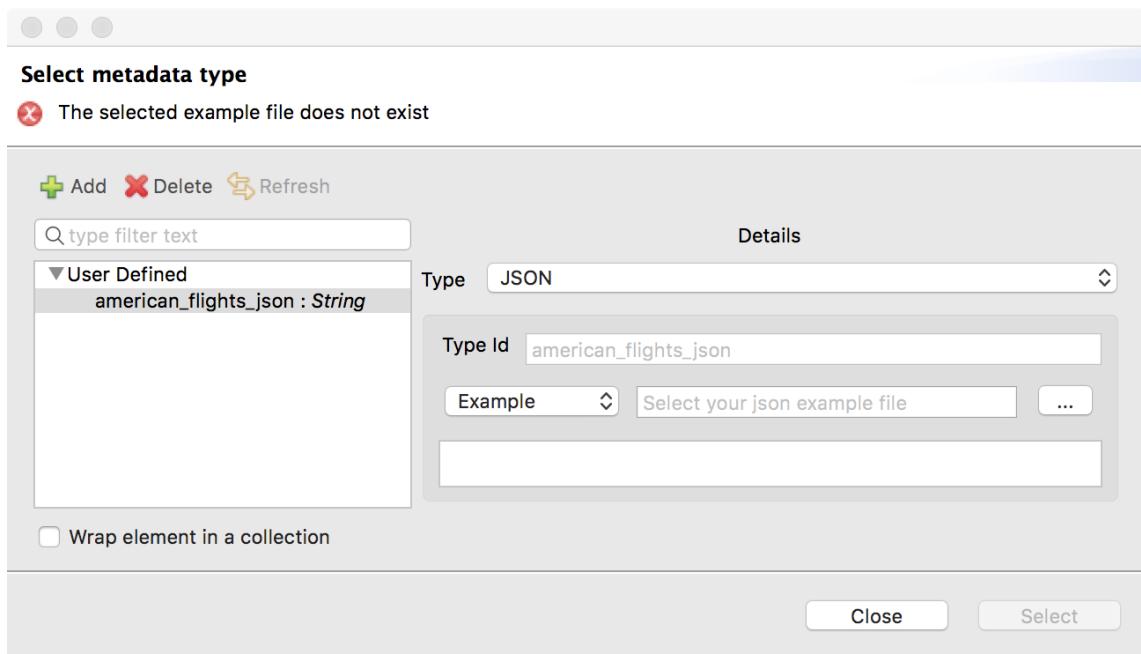

12. Double-click the Transform Message component in the canvas.

13. In the Transform Message properties view, look at the input section and review the payload metadata; it should match the data returned by the Database endpoint.

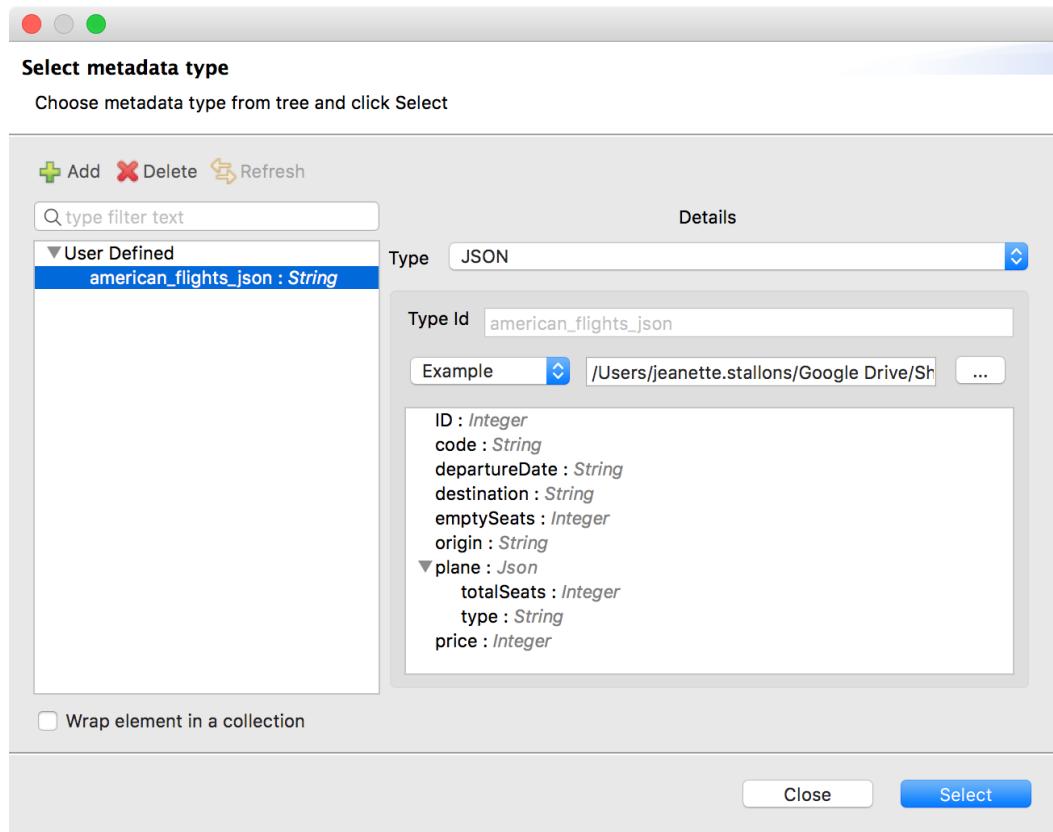

Add metadata for the transformation output

14. Click the Define metadata link in the output section.
15. In the Select metadata type dialog box, click the Add button.
16. In the Create new type dialog box, set the type id to american_flights_json.
17. Click Create type.
18. Back in the Set metadata type dialog box, set the type to JSON.
19. Change the Schema selection to Example.

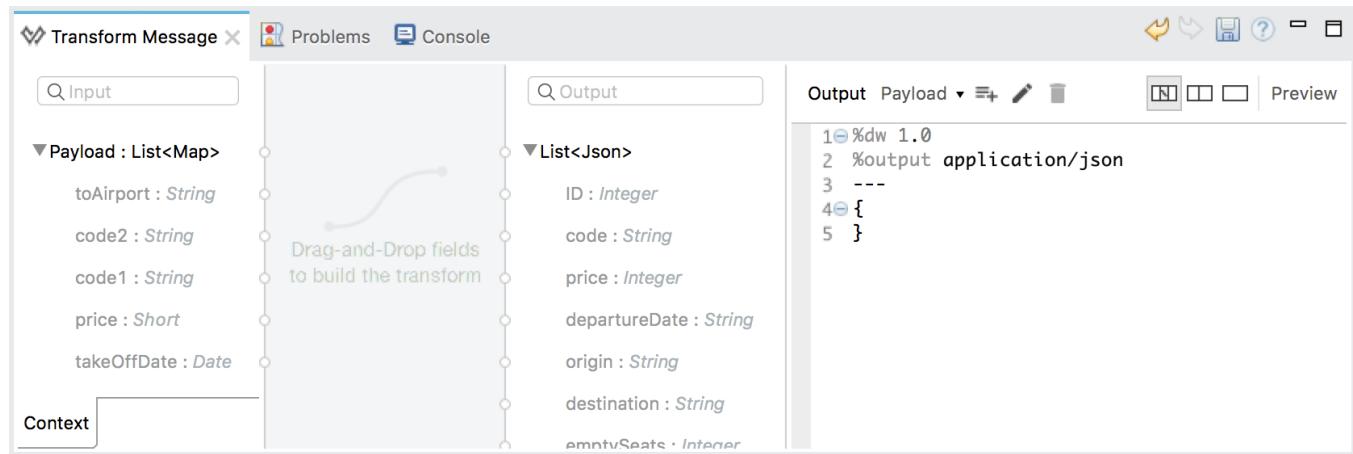

20. Click the browse button and navigate to the course student files.

21. Select american-flights-example.json in the examples folder and click Open; you should see the example data for the metadata type.

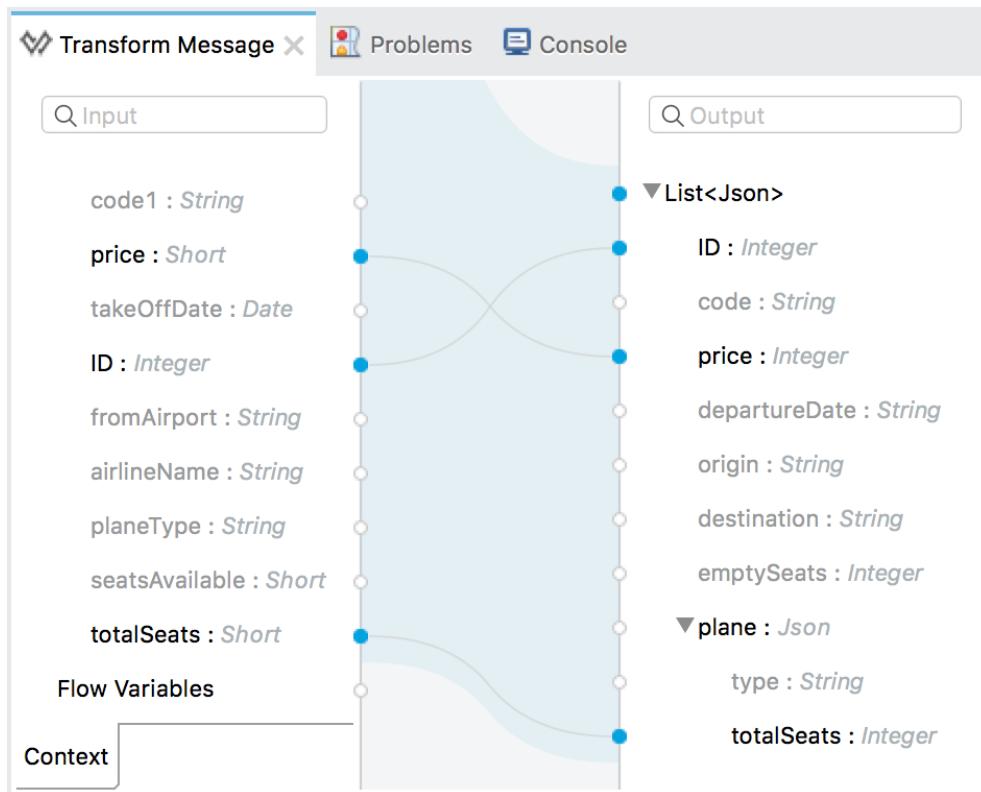

22. Click Select; you should now see output metadata in the output section of the Transform Message properties view.

Create the transformation

23. Map fields with the same names by dragging them from the input section and dropping them on the corresponding field in the output section.

- ID to ID
- price to price
- totalSeats to plane > totalSeats

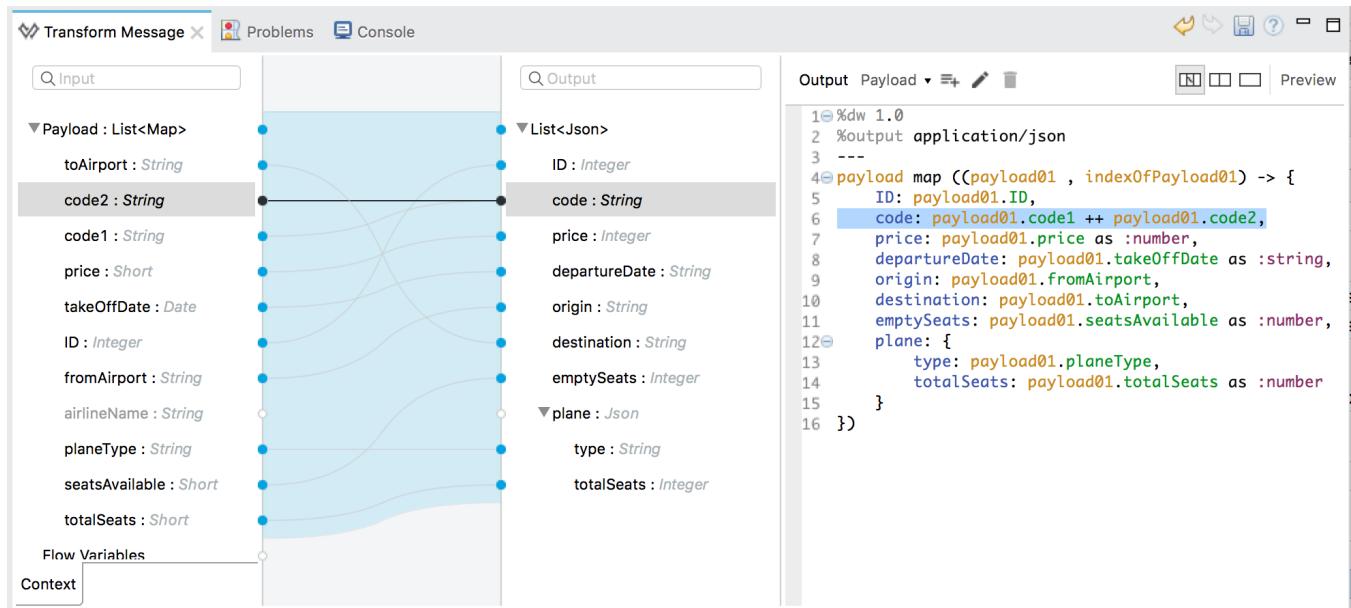

24. Map fields with different names by dragging them from the input section and dropping them on the corresponding field in the output section.

- toAirport to destination
- takeOffDate to departureDate
- fromAirport to origin
- seatsAvailable to emptySeats
- planeType to plane > type

25. Concatenate two fields by dragging them from the input section and dropping them on the same field in the output section.

- code1 to code
- code2 to code

Add sample data

26. Click the Preview button in the output section.

27. In the preview section, click the Create required sample data to execute preview link.

```
%dw 1.0
%output application/json
---
payload map ((payload01 , indexOfPayload01) -> {
    ID: payload01.ID,
    code: payload01.code1 ++ payload01.code2,
    price: payload01.price as :number,
    departureDate: payload01.takeOffDate as :string,
    origin: payload01.fromAirport,
    destination: payload01.toAirport,
    emptySeats: payload01.seatsAvailable as :number
})
```

[Create required sample data to execute preview](#)

28. Look at the input section, you should see a new tab called payload with sample data generated from the input metadata.

29. Look at the output section, you should see a sample response for the transformation.

```
%dw 1.0
%output application/java
---
[{
    toAirport: "?????",
    code2: "?????",
    code1: "?????",
    price: 1,
    takeOffDate: "2003-10-01",
    ID: 1,
    fromAirport: "?????",
    airlineName: "?????",
    planeType: "?????",
    seatsAvailable: 1,
    totalSeats: 1
}]
```

```
[ {
    "ID": 1,
    "code": "???????", "price": 1,
    "departureDate": "2003-10-01",
    "origin": "?????", "destination": "?????", "emptySeats": 1,
    "plane": {
        "type": "?????", "totalSeats": 1
    }
}]
```

30. In the input section, replace all the ???? with sample values.

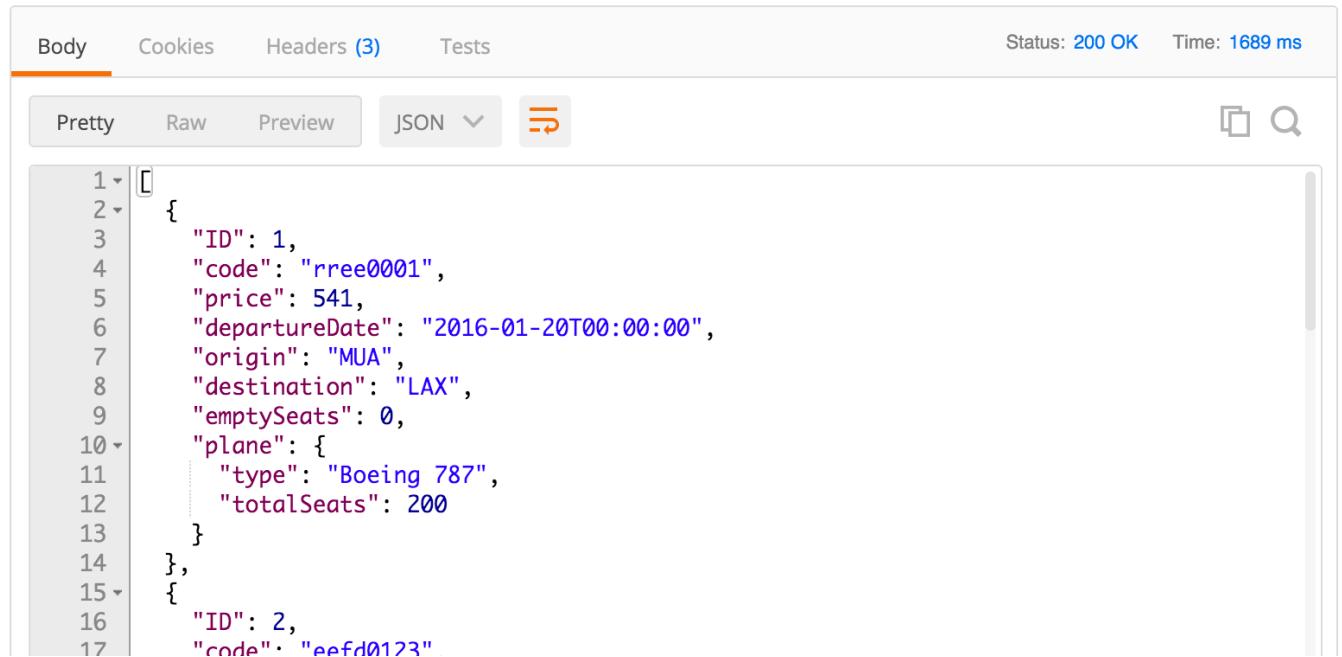

31. Look at the output section, you should see the sample values in the transformed data.

```
%dw 1.0
%output application/java
---
[{
    toAirport: "ORD",
    code2: "fdss",
    code1: "4334",
    price: 799,
    takeOffDate: "2016-10-21",
    ID: 1,
    fromAirport: "SFO",
    airlineName: "american",
    planeType: "Boeing 747",
    seatsAvailable: 1,
    totalSeats: 345
}]
```

```
[ {
    "ID": 1,
    "code": "4334fdss",
    "price": 799,
    "departureDate": "2016-10-21",
    "origin": "SFO",
    "destination": "ORD",
    "emptySeats": 1,
    "plane": {
        "type": "Boeing 747",
        "totalSeats": 345
    }
}]
```

Test the application

32. Run the project.
33. In Postman, make another request to <http://localhost:8081/flights>; you should see all the flight data as JSON again but now with a different structure.

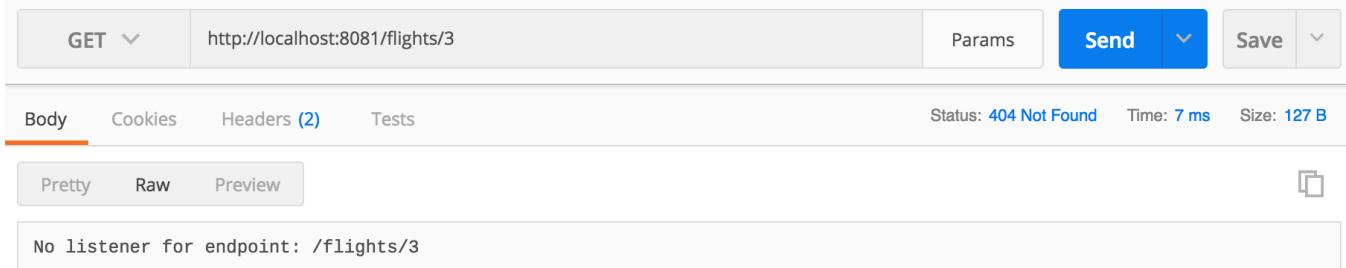

The screenshot shows the Postman interface with the 'Body' tab selected. The response status is 200 OK and the time taken is 1689 ms. The response body is displayed in JSON format, showing two flight records. Flight 1 has ID 1, code rree0001, price 541, departure date 2016-01-20T00:00:00, origin MUA, destination LAX, and 0 empty seats. Its plane is a Boeing 787 with 200 total seats. Flight 2 has ID 2, code eefda123.

```
[{"ID": 1, "code": "rree0001", "price": 541, "departureDate": "2016-01-20T00:00:00", "origin": "MUA", "destination": "LAX", "emptySeats": 0, "plane": {"type": "Boeing 787", "totalSeats": 200}}, {"ID": 2, "code": "eefda123"}]
```

Try to retrieve information about a specific flight

34. Add a URI parameter to the URL to make a request to <http://localhost:8081/flights/3>; you should get a 404 response with a no listener or resource not found message.

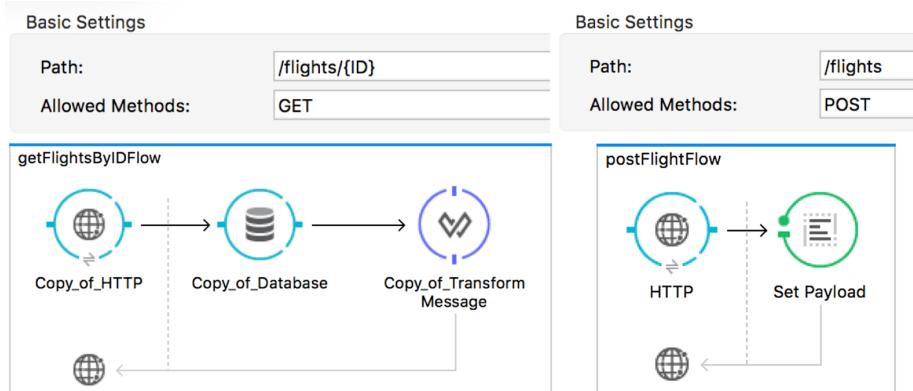

The screenshot shows the Postman interface with a GET request to http://localhost:8081/flights/3. The status is 404 Not Found, time is 7 ms, and size is 127 B. The response body says 'No listener for endpoint: /flights/3'.

35. Return to Anypoint Studio.
36. Look at the console; you should get a no listener found for request (GET)/flights/3.
37. Stop the project.

Walkthrough 4-4: Create a RESTful interface for a Mule application

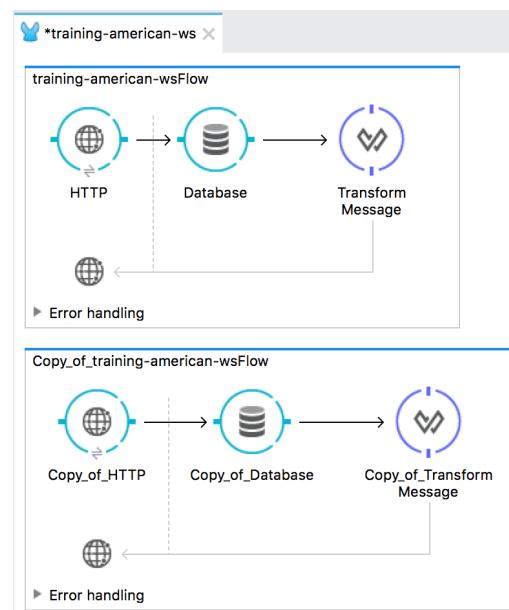

In this walkthrough, you continue to create a RESTful interface for the application. You will:

- Route based on path.
- Add a URI parameter to a new HTTP Listener endpoint path.
- Route based on HTTP method.

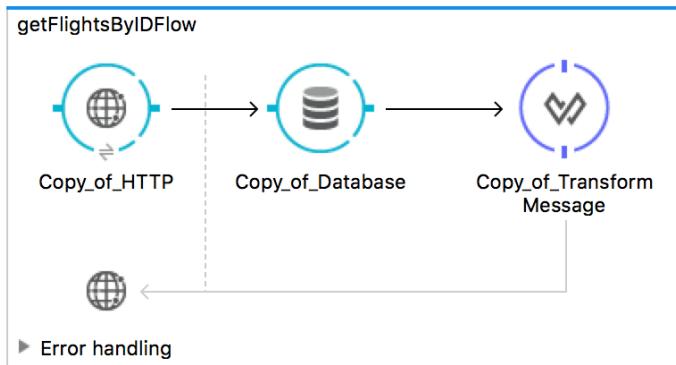

Make a copy of the existing flow

1. Return to training-american-ws.xml.
2. Click the flow in the canvas to select it.
3. From the main menu bar, select Edit > Copy.
4. Click in the canvas beneath the flow and select Edit > Paste.

Rename the flows

5. Double-click the name of the first flow.
6. In the Properties view, change its name to getFlightsFlow.
7. Change the name of the second flow to getFlightsByIDFlow.

Note: If you want, change the name of the message source and message processors.

Specify a URI parameter for the new HTTP Listener endpoint

8. Double-click the HTTP Listener endpoint in getFlightsByIDFlow.
9. Change the path to have a URI parameter called ID.

Basic Settings

Path:	/flights/{ID}
Allowed Methods:	GET

Modify the Database endpoint

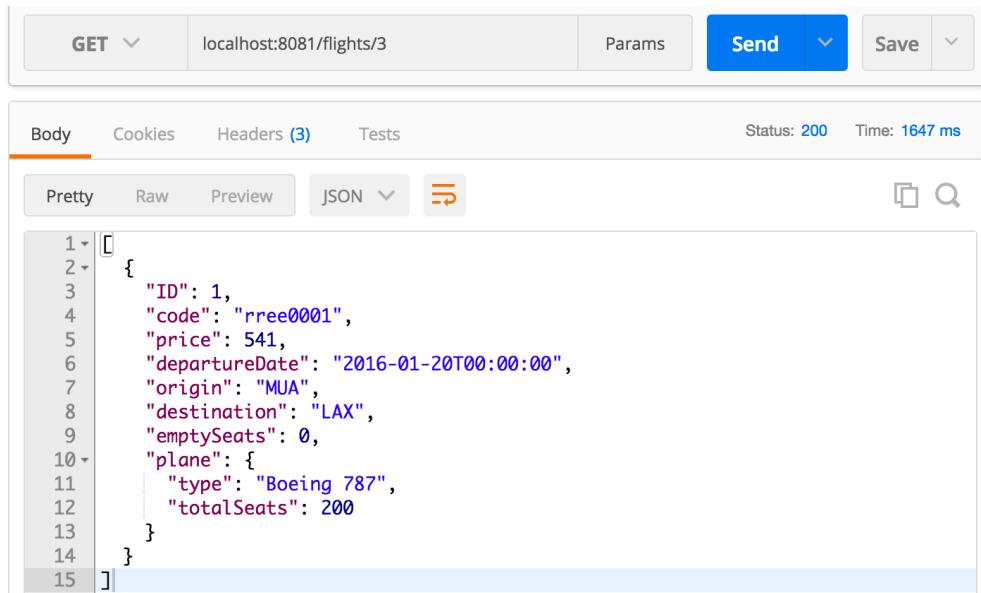

10. Double-click the Database endpoint in getFlightsByIDFlow.
11. Modify the query WHERE clause, to select flights with the ID equal to 1.

```
SELECT *
FROM american
WHERE ID = 1
```

Test the application

12. Run the project.

13. In Postman, make another request to <http://localhost:8081/flights/3>; you should see details for the flight with an ID of 1.

The screenshot shows the Postman interface with a successful API call. The URL is set to `localhost:8081/flights/3`. The response status is `200` and the time taken is `1647 ms`. The response body is displayed in Pretty JSON format:

```
1 [
2   {
3     "ID": 1,
4     "code": "rree0001",
5     "price": 541,
6     "departureDate": "2016-01-20T00:00:00",
7     "origin": "MUA",
8     "destination": "LAX",
9     "emptySeats": 0,
10    "plane": {
11      "type": "Boeing 787",
12      "totalSeats": 200
13    }
14  }
15 ]
```

Modify the database query to use the URI parameter

14. Return to the course snippets.txt file and copy the SQL expression for American Flights API.
15. Return to Anypoint Studio and stop the project.
16. In the Database properties view, replace the existing WHERE clause with the value you copied.

```
SELECT *
FROM american
WHERE ID = #[message.inboundProperties.'http.uri.params'.ID]
```

Note: You learn about reading and writing properties and variables in a later module in the Development Fundamentals course.

Test the application

17. Run the project.

18. In Postman, make another request to <http://localhost:8081/flights/3>; you should now see the info for the flight with an ID of 3.

The screenshot shows the Postman interface with a successful HTTP request. The URL is set to `localhost:8081/flights/3`. The response status is `200 OK` and the time taken is `1645 ms`. The `Body` tab is selected, displaying the JSON response:

```
1 [ ]  
2 {  
3   "ID": 3,  
4   "code": "ffee0192",  
5   "price": 300,  
6   "departureDate": "2016-01-20T00:00:00",  
7   "origin": "MUA",  
8   "destination": "LAX",  
9   "emptySeats": 0,  
10  "plane": {  
11    "type": "Boeing 777",  
12    "totalSeats": 300  
13  }  
14 }  
15 ]
```

19. Return to Anypoint Studio and stop the project.

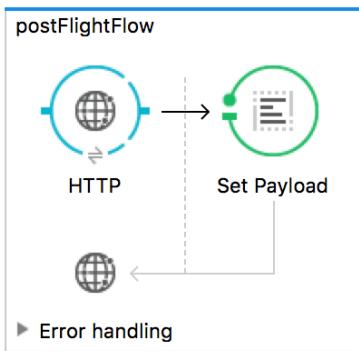

Make a new flow to handle post requests

20. In the Mule Palette, select the Connectors tab.
21. Drag out an HTTP connector from the Mule Palette and drop it in the canvas below the two existing flows.
22. Change the name of the flow to `postFlightFlow`.
23. Double-click the HTTP Listener endpoint.
24. In the HTTP properties view, set the path to `/flights` and the allowed methods to POST.

The screenshot shows the `Basic Settings` section of the Mule Studio Properties view for an HTTP Listener endpoint. The `Path` is set to `/flights` and the `Allowed Methods` are set to `POST`.

25. In the Mule Palette, select the Transformers tab.

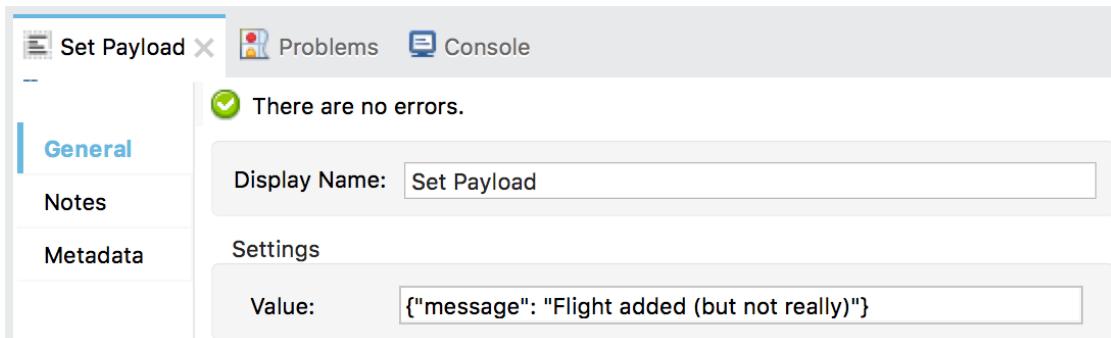

26. Drag out a Set Payload transformer from the Mule Palette and drop it in the process section of the flow.

27. Double-click the Set Payload processor.
28. Return to the course snippets.txt file and copy the American Flights API - /flights POST response example.

```
{"message": "Flight added (but not really)"}
```

29. Return to Anypoint Studio and in the Set Payload properties view, set value to the value you copied.

Note: This flow is just a stub. For it to really work and add data to the database, you would need to add logic to insert the request data to the database.

Test the application

30. Run the project.
31. In Postman, change the request type from GET to POST.
32. Remove the URL parameter from the request URL: <http://localhost:8081/flights>.

33. Send the request; you should now see the message the flight was added – even though you did not send any flight data to add.

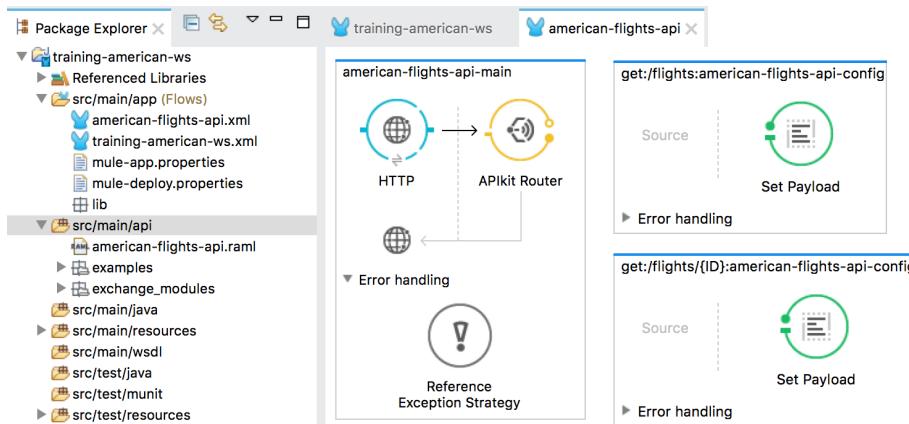

The screenshot shows a REST client interface. At the top, there are buttons for 'POST' (selected), 'Params', 'Send', 'Save', and a dropdown. Below this, the URL is set to 'http://localhost:8081/flights/'. The 'Body' tab is selected, showing a JSON response: `{"message": "Flight added (but not really)"}`. Other tabs include 'Cookies', 'Headers (2)', and 'Tests'. On the right, it says 'Status: 200 OK' and 'Time: 156 ms'. Below the body, there are buttons for 'Pretty', 'Raw', 'Preview', 'HTML' (selected), and a copy icon.

34. Return to Anypoint Studio and stop the project.

Walkthrough 4-5: Use Anypoint Studio to create a RESTful API interface from a RAML file

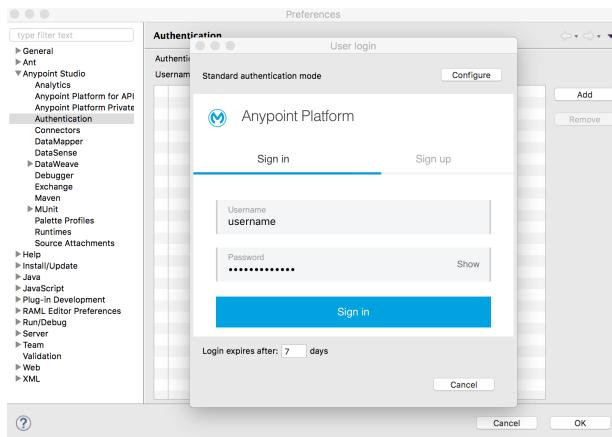

In this walkthrough, you generate a RESTful interface from the RAML file. You will:

- Add Anypoint Platform credentials to Anypoint Studio.
- Import an API from Design Center into an Anypoint Studio project.
- Use APIkit to generate a RESTful web service interface from an API.
- Test a web service using Postman.

Add Anypoint Platform credentials to Anypoint Studio

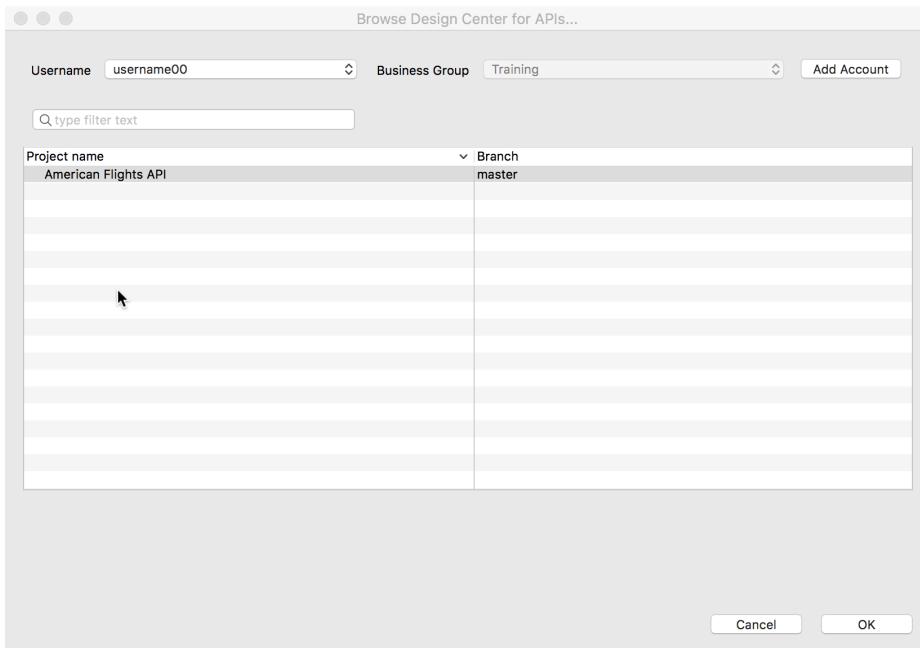

1. In Anypoint Studio, right-click training-american-ws and select Anypoint Platform > Configure Credentials.
2. In the Authentication page of the Preferences dialog box, click the Add button.
3. In the Anypoint Platform Sign In dialog box, enter your username & password and click Sign In.

4. On the Authentication page, make sure your username is listed and selected.
5. Click OK.

Add an API from Design Center to the Anypoint Studio project

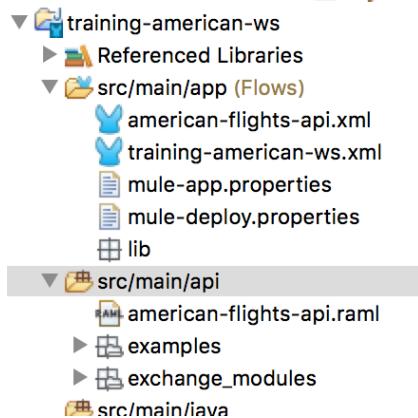

6. In the Package Explorer, locate the src/main/api folder; it should not contain any files.
7. Right-click the folder (or anywhere in the project in the Package Explorer) and select Anypoint Platform > Import from Design Center.
8. In the Browse Design Center for APIs dialog box, select the American Flights API and click OK.

9. In the Override files dialog box, click Yes.

Locate the API files added to the project

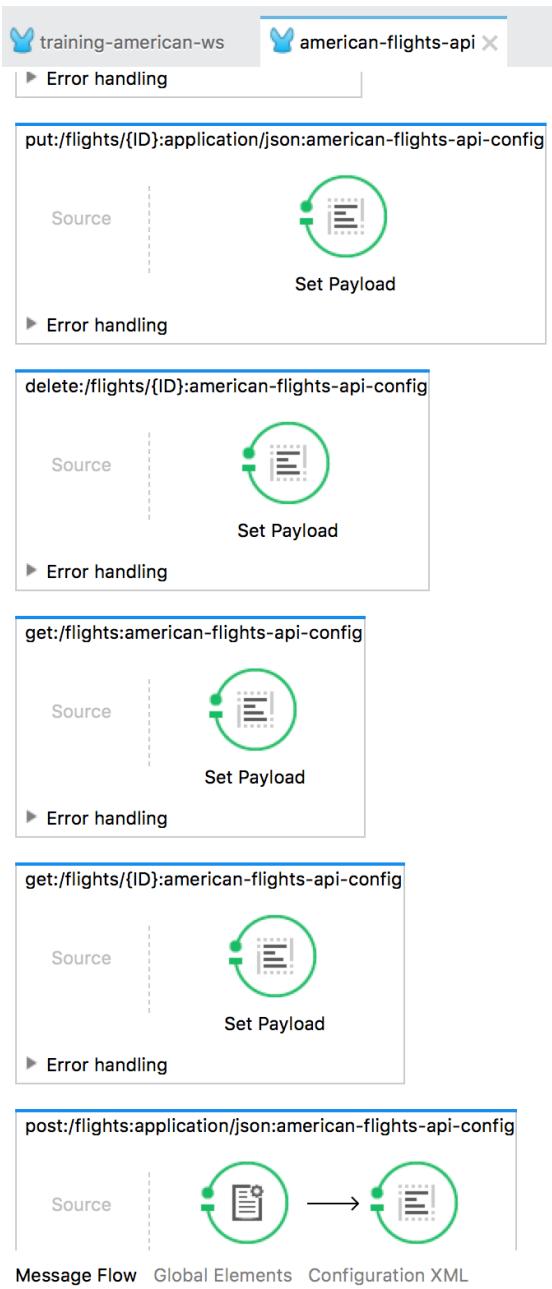

10. In the Package Explorer, locate and expand the src/main/api folder; it should now contain files.

Examine the XML file created

11. Examine the generated american-flights-api.xml file and locate the following five flows:

- get:/flights
- get:/flights/{ID}
- post:/flights
- delete:/flights/{ID}
- put:/flights/{ID}

12. In the get:/flights flow, double-click the Set Payload transformer and look at the value in the Set Payload properties view.

Settings

```
[  
{  
    "ID" : 1,  
    "code" : "ER38sd",  
    "price" : 400,  
    "departureDate" : "2017/07/26",  
    "origin" : "CLE",  
    "destination" : "SFO",  
    "emptySeats" : 0.  
}
```

13. In the get:/flights/{ID} flow, double-click the Set Payload transformer and look at the value in the Set Payload properties view.

Settings

```
{  
    "ID" : 1,  
    "code" : "GQ574",  
    "price" : 399,  
    "departureDate" : "2016/12/20",  
    "origin" : "ORD",  
    "destination" : "SFO",  
    "emptySeats" : 200,  
    "plane" : {  
        "id" : 1,  
        "name" : "Boeing 747-400"  
    }  
}
```

14. In the post:/flights flow, double-click the Set Payload transformer and look at the value in the Set Payload properties view.

Settings

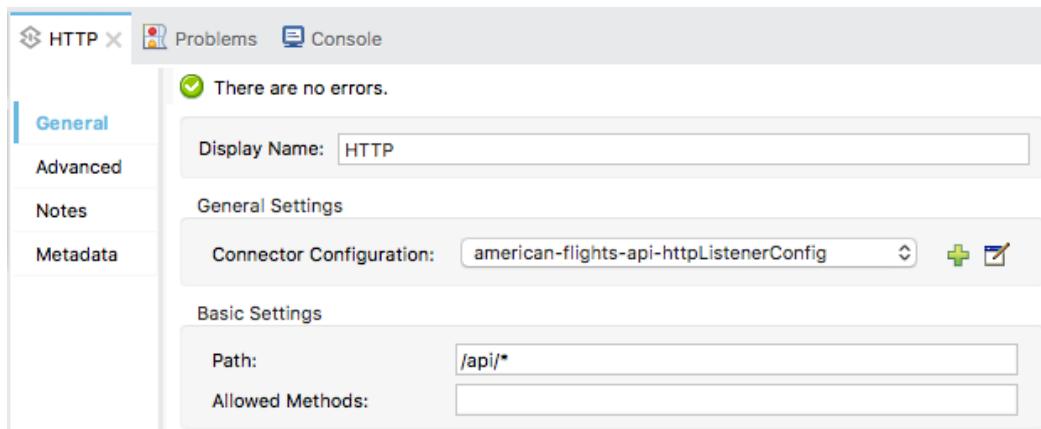

```
{  
    "message" : "Flight added (but not really)"  
}
```

Examine the main flow and the new HTTP Listener endpoint

15. Locate the american-flights-api-main flow.
16. Double-click its HTTP Listener endpoint.

17. In the HTTP properties view, notice that the path is set to /api/*.

*Note: The * is a wildcard allowing any characters to be entered after /api/.*

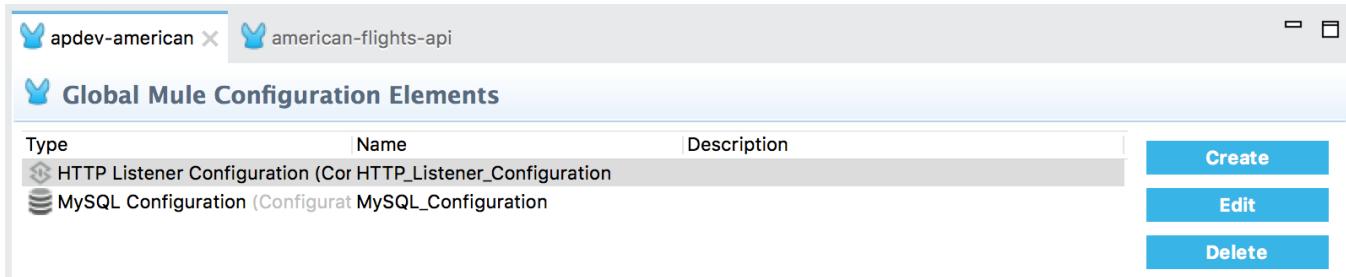

18. Click the Edit button for the connector configuration; you should see that the same port 8081 is used as the HTTP listener you created previously.

19. Click OK.

Remove the other HTTP configuration and listeners

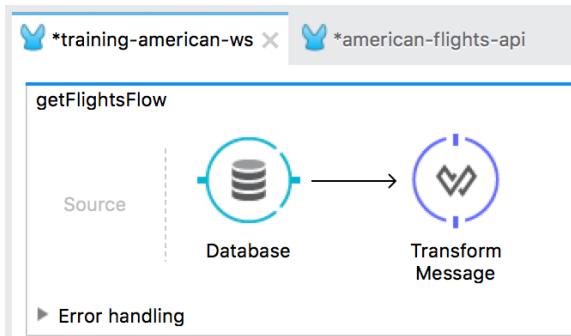

20. Return to training-american-ws.xml.

21. In the Global Elements view, select the HTTP Listener and click Delete.

22. Return to the Message Flow view.

23. Right-click the HTTP Listener endpoint in getFlightsFlow and select Delete.

24. Delete the other two HTTP Listener endpoints.

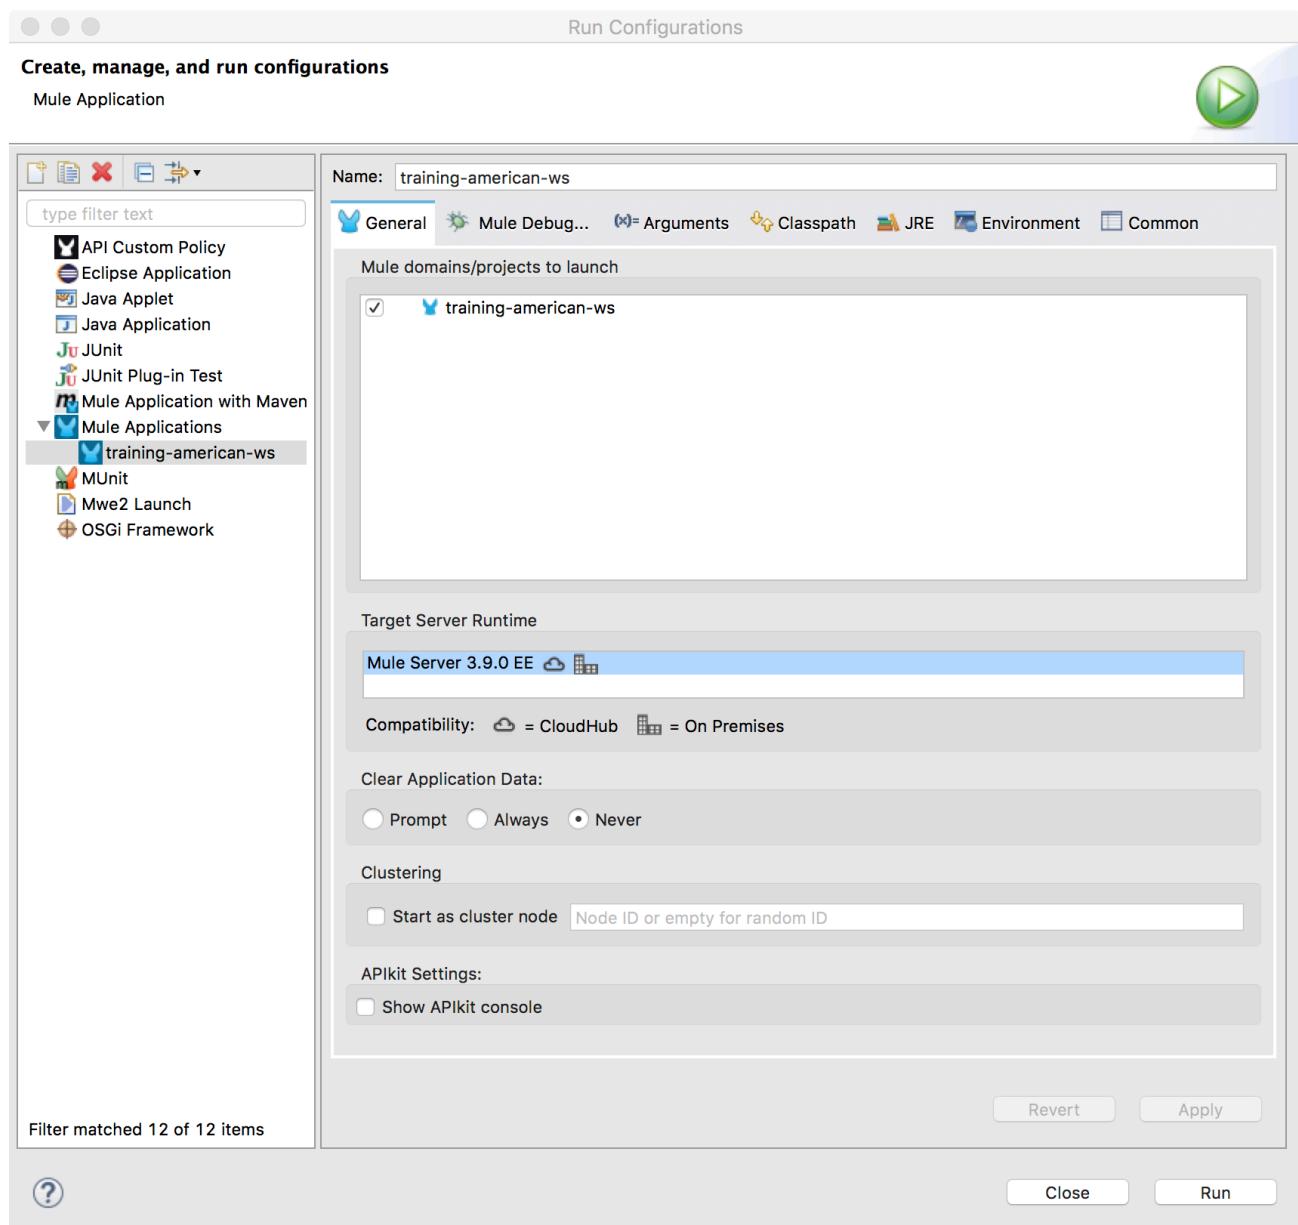

Disable the APIkit Consoles view

25. In the main menu, select Run > Run Configurations.

26. In the Run Configurations dialog box for training-american-ws, uncheck the Show APIkit console option located at the bottom of the General tab settings.

27. Click Run.

Note: If you want to use the APIkit Consoles view, you need to add a baseUrl to the RAML file in order for the Try-it functionality of the API console to work.

Test the web service using Postman

28. In Postman, make a GET request to <http://localhost:8081/flights>; you should get a 404 response with a message that the resource was not found because there is no longer a listener for that endpoint.

The screenshot shows the Postman interface with a GET request to <http://localhost:8081/flights>. The status bar indicates Status: 404 Not Found, Time: 27 ms, and Size: 126 B. The Body tab is selected, showing the response body: "No listener for endpoint: /flights/".

29. Change the URL to <http://localhost:8081/api/flights> and send the request; you should see the example data returned.

The screenshot shows the Postman interface with a GET request to <http://localhost:8081/api/flights>. The status bar indicates Status: 200 OK, Time: 14 ms. The Body tab is selected, showing the response body as JSON. The JSON data is as follows:

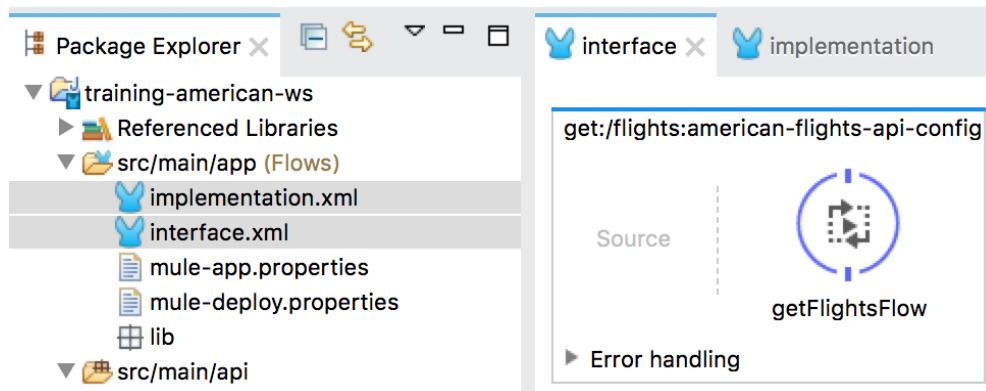

```
1 [ { 2 "ID": 1, 3 "code": "ER38sd", 4 "price": 400, 5 "departureDate": "2016/03/20", 6 "origin": "MUA", 7 "destination": "SFO", 8 "emptySeats": 0, 9 "plane": { 10 "type": "Boeing 737", 11 "totalSeats": 150 12 } 13 }, 14 { 15 "ID": 2, 16 "code": "ER45if", 17 "price": 345.99 18 }
```

30. Make a request to <http://localhost:8081/api/flights/3>; you should see the example data returned.
31. Return to Anypoint Studio and stop the project.

Walkthrough 4-6: Implement a RESTful web service

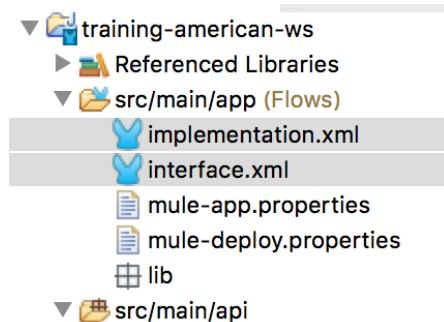

In this walkthrough, you wire the RESTful web service interface up to your back-end logic. You will:

- Pass a message from one flow to another.
- Call the backend flows.
- Create new logic for the nested resource call.
- Test the web service using Postman.

Rename the configuration files

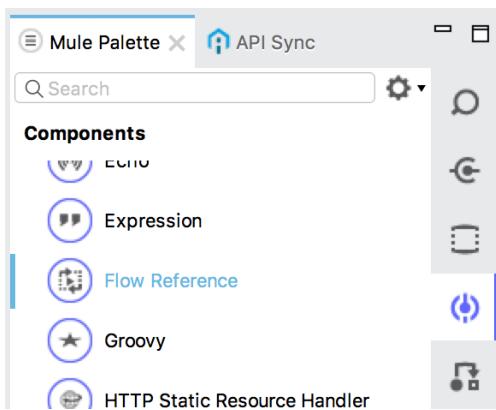

1. Right-click `american-flights-api.xml` in the Package Explorer and select Refactor > Rename.
2. In the Rename Resource dialog box, set the new name to `interface.xml` and click OK.
3. Right-click `training-american-ws.xml` and select Refactor > Rename.
4. In the Rename Resource dialog box, set the new name to `implementation.xml` and click OK.

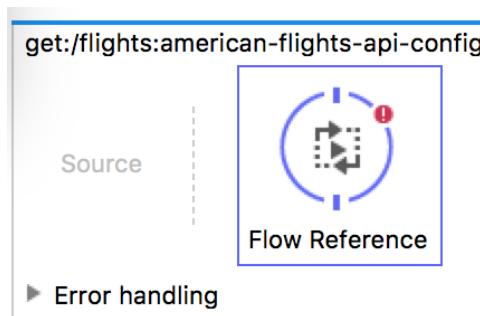

Set logic for the /flights resource

5. Return to `interface.xml`.
6. Delete the Set Payload transformer in the `get:/flights` flow.

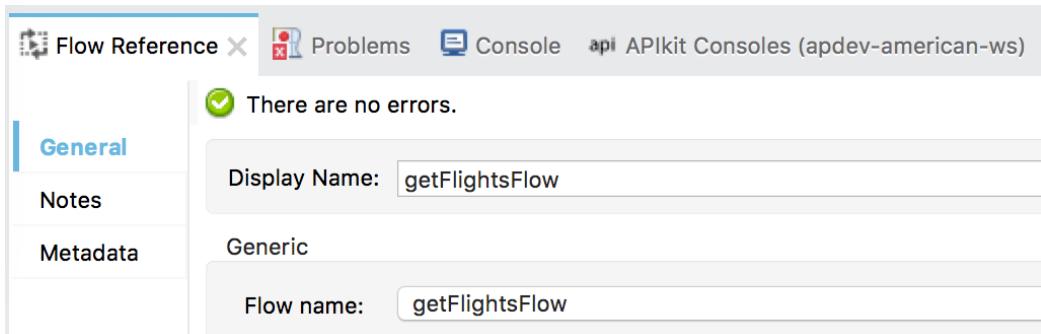

7. In the Mule Palette, select the Components tab.

8. Drag a Flow Reference component from the Mule Palette and drop it into the process section of the flow.

9. In the Flow Reference properties view, select getFlightsFlow for the flow name.

Set logic for the /flights/{ID} resource

10. Delete the Set Payload transformer in the get:/flights/{ID} flow.
11. Drag a Flow Reference component from the Mule Palette and drop it into the flow.

12. In the Flow Reference properties view, select getFlightsByIDFlow for the flow name.

13. Return to implementation.xml.
14. Double-click the Database endpoint in getFlightsByIDFlow.
15. Change the query to use a variable instead of a query parameter.

```
WHERE ID = #[flowVars.ID]
```

Query

Type: Parameterized

Parameterized query:

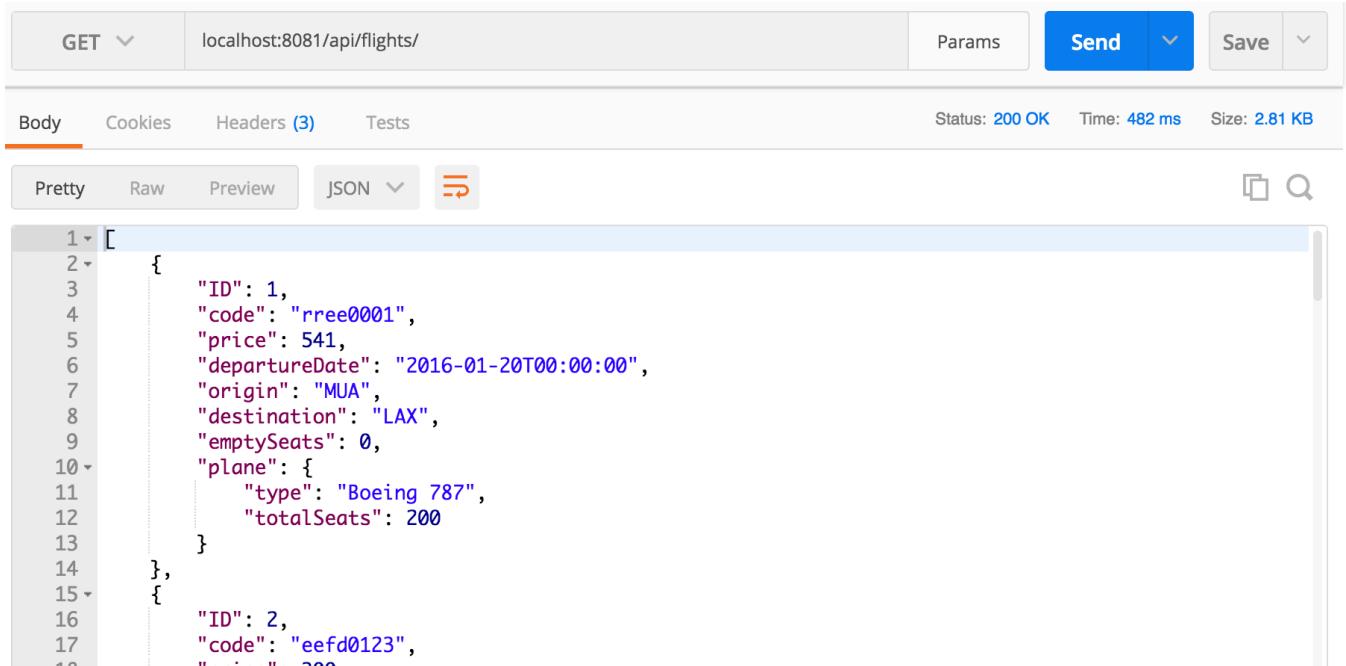

```
SELECT *
FROM american
WHERE ID = #[flowVars.ID]
```

Note: You learn about the different types of variables in later modules in the Development Fundamentals course.

Test the web service using Postman

16. Run the project.

17. In Postman, make a request to <http://localhost:8081/api/flights>; you should now get the data for all the flights from the database instead of the sample data.

The screenshot shows the Postman interface with a successful GET request to `localhost:8081/api/flights`. The response body is a JSON array containing two flight objects:

```
[{"ID": 1, "code": "rree0001", "price": 541, "departureDate": "2016-01-20T00:00:00", "origin": "MUA", "destination": "LAX", "emptySeats": 0, "plane": {"type": "Boeing 787", "totalSeats": 200}}, {"ID": 2, "code": "eefd0123", "price": 541, "departureDate": "2016-01-20T00:00:00", "origin": "MUA", "destination": "LAX", "emptySeats": 0, "plane": {"type": "Boeing 787", "totalSeats": 200}}]
```

18. Make a request to <http://localhost:8081/api/flights/3>; you should now get the data that flight from the database instead of the sample data.

19. Return to Anypoint Studio and stop the project.
